

## 14 Work Plan: Use It or Lose It

*By Joseph Brandon and Michael Damiano,  
SSPC: The Society for Protective Coatings*

This article is the fifth in a series on contracting. The authors discuss the Work Plan concept as a valuable tool for facility owners or those managing coatings projects for an owner. The article covers what to include in the Work Plan, how owners can use it, formats, documentation, and more.

## 29

## 2011 Equipment Buying Guide

This year's *Equipment Buying Guide* lists products, equipment, and supplies for protective and marine coating work from more than 450 manufacturers and distributors located throughout the world, but especially in North America and Europe. Product listings begin on p. 32, and contact information for each company begins on p. 102. As in previous years, the *Guide* is based on surveys completed by equipment companies known to JPCL.

## The Importance of Planning

**T**his issue of the *Journal of Protective Coatings & Linings* has an article on page 14 written by Mr. Joseph Brandon and Mr. Michael Damiano entitled, "Work Plan: Use it or Lose it." This article highlights the importance of planning in any coatings operation so that the facility owner insists on a thorough Work Plan that delineates the operation "from soup to nuts" in a concise manner to ensure that the coatings work being performed is being done right the first time, all the time.

*Webster's Dictionary* defines the word "plan" as "a method for achieving an end; an often customary method of doing something; and lastly, a detailed formulation of a program of action." I am a person who likes to execute but not to plan. Planning is difficult for me because I sometimes perceive that folks plan things to death, and nothing gets done. Due to my perception, I often found the steps I took were "fire, ready, aim," instead of stepping back, conceiving a plan, and then thoughtfully executing it. Many times I thought action had to be immediate, and I did not adequately plan. As I look back, good planning might have led to fewer missed critical steps and a better execution of what had to be done.

As many of you know, I have a military background. When I first joined the military, there was not nearly the level of planning that went on as when I retired. In the first years, we would all be briefed on what the operation was, maybe do a map reconnaissance, and then "mount up" and go execute it. In later years, we would receive the mission, build mock facilities and replicas of the terrain, go over many iterations of the operation on these replicas, and only then would we "mount up" and do the mission. Because of the increased amount of planning, everyone knew what was to be done at all levels. If one person was missing, someone else knew what he or she would have to do to fill in and continue to carry out the mission. It was quite an extensive process, but it paid dividends because peoples' lives were at stake. I have never been around any Special Operations Command Forces (Delta Force, SEALs, etc.), but the hours of rehearsal and practice that goes on for one of those operations is phenomenal. It has been reported that SEAL Team 6 rehearsed their mission for months before going into Pakistan.

The most important part of planning is reviewing all the contingencies. What happens if this key person does not show

up for work? What happens if this key piece of equipment fails? What is our backup plan? In a coatings operation, how do we continue to get the job done and meet the owner's specification and timeline? When things go wrong, it is not the time to scramble for solutions.

Brandon and Damiano's article gives some great ideas on the importance of a thorough and detailed Work Plan. Just like the military's strategic and operation planning, the coatings Work Plan gives the people who execute the job, at all levels, the detail and guidance they need to meet the specification and the owner's expectations. With a detailed plan, the coatings job is done right the first time, every time. Good planning should also save the contractor time and money by instituting procedures that become routine.

One of the most important results of having a good Work Plan is that the planning process should take in all aspects of safety on the job. Detailed safety planning has to be an integral part of the entire Work Plan. I used to say, "You only go around once in life, and this ain't no dress rehearsal." The same thing applies when you start a job. Once you start, "it ain't no dress rehearsal."

An aspect of planning that is often missed is what happens when the job is finished. In the military, we had a process called the "after action review." People were gathered, and everyone assessed what was done right and what was done wrong. It was the best teaching tool we had. People admitted when errors were made, and they never pointed fingers. People were able to admit their mistakes because no adverse action was taken against them. It was purely a learning tool. A contractor and owner should do the same and learn from the way each does business. Then, if the contractor does work for the owner again, the same mistakes do not occur.

Again, I invite you to read the article. Better planning yields better execution, and, as a result, coatings jobs that are done right every time.

*Bill*

Bill Shoup  
Executive Director, SSPC

## Pull-Off Adhesion Testing Webinar Slated for July

**A**n SSPC/JPCL Education Series Webinar, "Pull-Off Adhesion Testing," will be presented by David Beamish of DeFelsko on July 13, 2011 from 11:00 a.m. to noon, EST.

Adhesion is one of the key properties of a protective coating and can be measured by ASTM D4541, Standard Test Method for Pull-Off Strength of Coatings Using Portable Adhesion Testers. This method measures the minimum tensile strength necessary to detach the coating in a direction perpendicular to the substrate.

The webinar, presented at a basic level, will explain how to perform an adhesion pull-off test accu-

David Beamish

rately and will review the factors that can affect test results, such as thickness of the test substrate, dolly size, degree of cure, type of test instrument, operator skill, and consistency and rate of load.

Free registration for the webinar is available online at [www.paintsquare.com/education](http://www.paintsquare.com/education).

Education Series Webinars provide continuing education for SSPC recertifications, as well as technology

updates on important topics. While participation in the webinar is free, for those who wish to receive continuing education credits from SSPC, a test is available after the webinar. Cost of the test service is

\$25. All participants receive a free certificate of completion.

### SSPC Seeks 2012 Structure Award Nominations

**S**SPC is accepting nominations from the membership for the annual Structure Awards. The awards recognize the work of teams of contractors, designers, end users, and coating manufacturers for excellence on particular coatings projects.

Winning projects will be honored at the Awards Luncheon during SSPC 2012 featuring GreenCOAT, which will be held in Tampa, FL. The luncheon is scheduled for Jan. 31. Winners will also be featured in a photo essay in *JPCL* after the conference as well as reported in *PaintSquare News*.

All types of structures are eligible, including bridges, tanks, concrete structures, and industrial or commercial facilities. The work on the structures must have been completed between July 1, 2010 and June 30, 2011, except for the Charles G. Munger Award for longevity and the Military Coatings Project Award of Excellence.

The deadline for nominations is Oct. 31, 2011. A representative of the structure owner must attend the awards luncheon to accept the award and give permission for the information to appear in *JPCL*.

Coating work on the Hoover Dam Bypass/Colorado River Bridge won the Crone Knoy Award in 2011

Award categories include the Charles G. Munger Award, the William Johnson Award, the George Campbell Award, the Crone Knoy Award, and the Military Coatings Project Award of Excellence. Details on the award categories are available from SSPC ([sspc.org](http://sspc.org)) and appear in the May 18 *PaintSquare News* announcement. Visit [www.paintsquare.com](http://www.paintsquare.com)

or use your smart phone to capture this barcode to access the story directly.

For more information or a copy of the nomination form, contact Terry Sowers, SSPC Director of Member Services, at 877-281-7772 ext.2219, or [sowers@sspc.org](mailto:sowers@sspc.org).

**Did you know** that as a subscriber to *JPCL* you also get each digital edition for free?

You can receive the digital, online *JPCL* right in your inbox, giving you a convenient way to read each month's issue at your desktop, on your laptop, or even from your smartphone.

## SCAQMD Updates Coatings Rules

**A**fter more than two years of drafts and discussions, the South Coast Air Quality Management District has amended and published its Rule 1113, "Architectural Coatings," which applies to any coating, including those for industrial maintenance (IM), intended for application in the field to stationary structures in the District. The amended rule was approved June 3, 2011.

The Rule is intended to regulate the level of volatile organic compound (VOC) content of coatings because VOCs contribute to the formation of smog.

Some changes affecting IM coatings are listed below.

- Applicability: widened to include persons who market architectural coatings and those who store architectural coatings at a worksite
- IM category: expanded to include non-sacrificial anti-graffiti coatings
- Colorants: VOC content regulated separately when the colorant is added to any coating at the point of sale (limits set in grams of VOC per liter of colorant).

VOC limits on most IM coatings remain at 100 grams of VOC per liter of coating, excluding colorants as defined above.

Many other amendments affect coatings relevant to maintenance coating work, and effective dates of the changes vary, as noted in the regulation. SCAQMD says the changes will reduce VOC emissions and clarify implementation issues.

For more information: [www.aqmd.gov](http://www.aqmd.gov).

## Hi-Temp Names Regional Managers

**H**i-Temp Coating Technology (Acton, MA) has named Dean Habegger and Stan Osborne as regional managers covering the western and northwestern states.

Habegger has over 38 years of experience

in the protective coatings industry.

Osborne has 35 years of experience in the protective coatings industry and is a member of SSPC and NACE.

## DoD Corrosion Conference Heads to California

**T**he 2011 Department of Defense (DoD) Corrosion Conference, sponsored by NACE International, will be held at the La Quinta Resort and Club near Palm Springs, CA, from July 31 to Aug. 5. SSPC is a co-sponsor of this year's conference. The conference will encompass all branches of the military. Hosted by the Army, this year's conference will cover the equipment and facilities that continue to combat corrosion. The conference is held every other year.

*Daniel J. Dunmire,  
Director, DoD Corrosion  
Policy and Oversight*

Bill Shoup, Executive Director of SSPC, will take part in the Corrosion Education Panel on Monday, Aug. 1, at noon during lunch and the Afternoon Opening Plenary Session.

The conference will present topics impacting the military's readiness, safety, logistics, and cost for both equipment and infrastructure. There are four parallel generic tracks: Corrosion Policy, Corrosion Science, Corrosion Technology, and Corrosion Resistant Material. Within each generic track, there are several specialty sessions, some of which require several contiguous morning and afternoon sub-sessions to provide enough time for all approved briefings.

A full exhibition is planned for Aug. 1 to Aug. 4. Hours vary by day. At press time the schedule for the exhibition hall is:

- Monday, Aug. 1, 8:00 a.m. to 3:00 p.m.
- Tuesday, Aug. 2, 9:00 a.m. to 4:00 p.m.

## SSPC's Shoup Visits Indonesia

**S**SPC Executive Director Bill Shoup; Abdul Rashid, PCS of AR786 Engineering Consulting; and Patrick Tan, Business Development Manager for In-Spec Corporation Pte. Ltd., are shown above in the SSPC booth at the Indocoating 2011 Conference in Batam, Indonesia, held May 4-7. In addition to attending the conference, Shoup toured Singapore and Indonesia and met with SSPC members while in the region.

- Wednesday, Aug. 3, 2:00 p.m. to 4:00 p.m.
- Thursday, Aug. 4, 9:00 a.m. to 4:00 p.m.

New this year, the DoD will present the Department of Defense Corrosion Bowl Award. The award is for collaborative efforts by a research team from two or more universities in meeting DoD needs in corrosion prevention and control through unique and innovative research that develops or leads to the use of better testing, analysis, material, processes, assessments, or designs for corrosion prevention and control. To be eligible for the award, the research must be a student collaborative activity of two or more accredited universities, be applicable to the DoD, and be presented by the research team at the poster session of the Conference.

For more details and updated information, visit <http://events.nace.org/conferences/dod2011/index.html>.

## On Using Surface-Tolerant Coatings

***This Month's Question: When specifying coatings for maintenance repainting of structural steel, under what conditions is it acceptable to settle for a surface-tolerant system, and when is such a system unacceptable?***

**Bob Kogler**

*Rampart, LLC*

"Surface tolerant" has been a hopeful description of various industrial coating systems over the years. This moniker plays on the unending search for the magical coating system that, through the miracle of materials science, can mitigate the costly and painstaking nature of surface cleaning and preparation. Rational analysis of the available information tells us that there are certainly coating materials that provide some level of robustness to less-than-ideal surface preparation. More accurately, some materials are engineered to extend the envelope of practical application conditions. But there really are no coating systems or materials available that provide an alternative to the need for high-quality surface preparation to achieve long-term high performance in aggressive environments.

That said, the cause is not lost. Based on years of direct and indirect involvement in independent coatings evaluation for bridge and marine infrastructure owners, my opinion is that the key to the "surface tolerant" question is proper management of expectations through a rational engineering approach. Owners and their representatives must analyze the exposure conditions on a macro and micro level, and

define the specific environmental stresses a coating system will see during its service life. Some analysis can be of fact (test data, direct observation); some must be educated guesses. (Will the bridge joints fail and conditions on the steel worsen over time?)

With such an approach, custom solutions can target resources at the worst exposure conditions, while stretching resources (and, likewise expectations for performance) over less harsh areas of the structure. For areas deemed less aggressive or less critical (structurally or aesthetically), a less robust coating system (surface preparation and coating material combination) can be used. An example of this hybrid approach is "zone painting" of structures: Areas with significant run-off and splash are blasted and painted while the rest of the steel is spot primed and overcoated after using a much less costly surface preparation technique.

The bottom line comes down to cost and expectations. Many successful jobs have used less aggressive, less expensive surface preparation coupled with coatings engineered to be "surface tolerant." But "successful" was defined by the performance expectations. In my experience in the highway community, for example, the philosophies of the bridge owner agencies were generally split almost equally between full blast removal and repaint versus the aggressive use of overcoating. Owners on both sides were happy and disappointed with their results, but the key to their

satisfaction always seemed to be how realistic their performance expectations were for the job. Owners who went into an overcoating job on a bridge in a marine environment expecting 20 years were always disappointed. However, the same system used on a bridge in a moderate exposure with a going-in plan for targeted touchup at five-year intervals claimed success and savings.

Choosing a surface-tolerant coating over less than optimum surface preparation can be okay, depending on the risk tolerance of the owner in that particular case. In aggressive environments that are difficult and expensive to access, critical structures almost always merit investment in high-quality surface preparation. But structures (or parts of structures) in less aggressive environments or with easier access for maintenance may be excellent candidates for a thorough washing, power-tool cleaning, and application of a surface-tolerant system. In the latter case, the owner is consciously taking on some measure of risk. That risk can be mitigated with good specifications, quality materials, and professional contractors.

Bob Kogler is a principal with Rampart, LLC. Previously with the Federal Highway Administration, he led the agency's corrosion protection and coatings research efforts for the past decade, including the Bridge of the Future research team. A JPCL Contributing Editor, he has written articles on a wide range of topics. He is also a past president of SSPC.

*Editor's Note: JPCL's Problem Solving Forum questions are also posted and answered on the electronic daily newsletter, PaintSquare News. To subscribe, visit [www.paintsquare.com](http://www.paintsquare.com).*

## The Case of the Coal Tar Epoxy That Fizzled: Protecting Concrete in a Wastewater Treatment Plant

By Ray Tombaugh, KTA-Tator, Inc.  
Richard A. Burgess, Series Editor, KTA-Tator, Inc.

One of my clearest memories from my seventh grade general science class is one of our “lab day classes,” when we saw what happened when a (weak) acid solution was dropped onto rocks. The drops began to bubble and fizz when the acid landed on some of the rocks, but it did nothing exciting when it landed on other rocks. The lesson? Rocks made of limestone fizz when treated with acid. Through trial and error around the home, similar experiments on all sorts of surfaces segregated the fizzers from the non-fizzers. Concrete and cement were in the fizzer group. Fun? Certainly. Useful? Perhaps, as we shall see from this month’s case.

During the construction of a wastewater treatment facility in 2007, the wetwells and other basins were coated with a coal tar epoxy. Within a year and a half after commissioning, the plant operators noticed that the coating was delaminating from the walls of several clarifier wetwells. Yet inspections of the clarifier basins showed no coating failures. The facility management wondered why the failures were occurring only in the wetwells, even though the same coatings were applied to the clarifier basins at the same time and in the same manner. The coating contractor was requested to investigate the failure of the wetwell coatings to determine the cause and to determine whether the problem was more widespread.

### Background

The specification for the coating work required that the concrete surfaces be prepared in accordance with SSPC-SP

13, “Surface Preparation of Concrete,” and ASTM D4259, “Standard Practice for Abrading Concrete.” Abrasive blasting was required to open all surface voids, bugholes, and air pockets. In addition, the specification called for the blast cleaning to impart a surface profile with a roughness equal to or smoother than 80-grit sandpaper. Bugholes were to be filled with grout.

The painting schedule in the specification required that a coal tar epoxy coating be applied to the prepared concrete in one coat to achieve a dry film thickness (DFT) of 16 mils. Several coating manufacturers were identified as having suitable coal tar epoxies, and the contractor selected one of the identified coatings for use. The manufacturer’s data indicated that the coal tar epoxy is self-priming; is normally applied at 16 mils (in one or two coats); and may be applied to properly prepared, cured concrete (28 days). Application was by spray and then back-rolled, as the manufacturer’s data sheets allowed.

High voltage spark testing was to be performed once the coating was applied and also once the coating had cured. Holiday testing can be conducted on concrete as long as it can be properly grounded and there is enough moisture in the concrete to carry the current. (Typically, there is enough moisture to perform the test.) Grounding is achieved either by direct contact to rebar or by attaching the instrument’s ground to wet window

screen that is pressed against the surface of the concrete with sand bags. Tensile adhesion tests were also required at two locations in each basin.

### Field Investigation

During the investigator’s initial visit to the facility, the water levels were at normal operating levels in the primary effluent wetwell. The coating had blistered in many areas, with open and intact blisters at and above the water line. The concrete below open coating blisters appeared degraded, with aggregate visible in some areas (Fig. 1).

*Fig. 1: Condition of the coating at the primary effluent wetwell hatch. Coating failures were observed only at the water line area. Photos courtesy of KTA-Tator*

The coating at the lip of the wetwell was tightly bonded to the concrete and difficult to remove. The coating had to

be removed with a chisel and disbonded in small pieces (Fig. 2). The investigator determined that a second site visit should be performed after the wetwell was drained to provide access for investigating the surfaces that had been immersed.

Thus, before the second site visit, the owner drained the wetwell to permit entry, and the contractor pressure water washed the walls to remove the slimy surface layer that would have impeded direct access to the coating surface.

The field investigation consisted of visual observations, adhesion assessment, and pH measurements. Adhesion

was measured in accordance with ASTM D6677, "Standard Test Method for Measuring Adhesion by Knife," which involves making an X-scribe in the paint film and then lifting the coat-

Fig. 2: Above the water line, the coating was tightly bonded and had to be chipped off with a chisel.

Fig. 3: Typical condition of the coating below the water line after pressure water washing. Note the blisters that cover the surface of the coating. Also note the exposed aggregate after the degraded coating and concrete were removed.

Fig. 4: An example of the white deposits (gypsum) found on some of the blister caps

Fig. 5: An example of the condition of the wetwell walls where the coating had lifted and had broken apart. The underlying concrete is extremely soft. The coating is brittle.

ing with the knife blade at the intersection of the incisions. Adhesion is rated according to the amount of coating removed by the knife on an even-number scale of 0 to 10, with 10 being best.

During the pressure washing, portions of coating and underlying soft concrete were removed, exposing the aggregate. The surrounding coated areas were blistered, and the blister caps were generally intact. The blisters ranged in size from  $\frac{1}{32}$  of an inch to 2 inches in diameter (Fig. 3). Close examination of the blisters showed that white spherical deposits were visible on the surface of the blister caps (Fig. 4).

Slime was also visible on the surface of the coating in areas that had not been pressure water washed, and the coating was delaminated from the surface and broken open, exposing soft concrete, which could be probed with a knife up to two inches in depth (Fig. 5). The coating that had delaminated was very brittle and broke easily when flexed. The pH of the process water coming over the weir was measured at 8 (slightly alkaline), whereas the pH of the soft concrete measured in two locations was 2 and 3 (acidic).

Some areas above the water line were blister free while other areas were blistered.

Adhesion tests performed on the  
**Continued**

coating in blistered (but intact) and non-blistered areas showed excellent adhesion (ASTM D6677: 8 to 10). Because the coating was tightly adhered to the concrete in these areas, the investigator concluded that the concrete had not yet degraded in them.

Conditions similar to those in the primary effluent wetwell were observed in the roughing filter wetwell. Small blisters (between  $\frac{1}{16}$  and  $\frac{1}{4}$  of an inch in diameter) were observed on all surfaces of the wetwell (above and below the water line) as well as on the coated roof of the wetwell, which was dripping wet. There were also larger blisters (1–2 inches in diameter) above the water line and on the roof (Fig. 6). Some blisters had opened, exposing soft cement and aggregate underneath the coating.

Adhesion tests were conducted in this wetwell, and all resulted in poor adhesion grades (ASTM D6677: 0 and 2). The pH on the top surface of the wet coating was 8, and the pH of fluids removed from beneath split blisters was 2 and 3.

No visible failures were observed on any of the primary basins.

Samples of the tightly adherent and delaminated coating along with samples of the underlying soft concrete were collected for laboratory analysis. In addition, a core sample of the concrete with tightly adherent coating was removed for examination. The coating removed from this sample was glossy and somewhat brittle but significantly more flexible than samples of the delaminated coating. The broken blister caps that had white deposits on the surface were very brittle and had a matte appearance. Bits of concrete were attached to the backs of the degraded coating.

### Laboratory Investigation

Infrared (IR) spectroscopy of the degraded coating indicated that it was an epoxy and consistent in formulation with the control sample obtained from the manufacturer; however, the site sample had significantly less epoxy than the control.

*Fig. 6: The roughing filter wetwell had both large and small blisters ( $\frac{1}{16}$  inch to 2 inches in diameter) on the walls and roof. Some had opened up to expose soft concrete.*

Chemical analysis (IR spectroscopy) of the underlying soft concrete determined it to be primarily gypsum (calcium sulfate).

Scanning Electron Microscopy-Energy Dispersive X-Ray Spectroscopy (SEM-EDS), an analysis that identifies the presence of chemical elements, showed that the white deposit on the surface of the blister cap samples was primarily composed of carbon, oxygen, silicone, sulfur, and calcium. Additionally, a moderate amount of sodium, aluminum, and phosphorous was identified in the white deposit. The chemical formula for gypsum is  $\text{CaSO}_4 \times 2(\text{H}_2\text{O})$ , which suggests that the white deposits and white material behind the coating layers were primarily gypsum with other dirt and debris.

Laboratory pH measurements were in agreement with the field results. The pH of the failed coating samples removed from the wetwells ranged from 2.2 to 3.13. The pH of a non-failing sample

removed from the lip of the wetwell had a pH of 9.89.

The DFT of the coal tar epoxy coating ranged between 15.6 and 24.4 mils.

Microbiological analysis of the degraded concrete indicated that it had large quantities of acid-producing and sulfate-reducing bacteria.

### Discussion

The field and laboratory investigators determined that the coating degradation was due to exposure to a highly acidic environment caused by microbiological activity.

The pH readings recorded in the wetwells indicated that while the process water was fairly neutral (pH of 7 to 8), the environment within the coating where the failures had occurred was highly acidic (pH of 2 or 3). At acidic pH levels such as those found

behind the coating, degradation of the binder in the coating (epoxy) will occur. Chemical attack was verified by observations of two common signs.

- Very brittle condition and loss of gloss of the coating that was exposed to the acidic conditions as compared to the control
- Relatively weak concentrations of the epoxy component remained in the degraded coating (determined through IR spectroscopy) when compared to the control sample.

Once the binder in a coating breaks down, acidic water permeates the coating and results in degradation of the concrete and blistering of the coating. Analysis of the soft material behind the coating determined that the material was primarily gypsum, along with other constituents of the concrete. The gypsum had formed as a result of a reaction between the concrete and the sulfuric acid that the bacteria introduced.

## Cases from the F-Files

Since pH measurements indicated that the sulfuric acid was not from the process water, the likely source was a localized condition next to the coating. Sulfuric acid in a wastewater treatment plant (other than from the process water) often results from oxidizing bacteria that live in the wastewater systems.

By design, a wetwell supports this reaction since hydrogen sulfide is released from the process water as it passes over the weir into the wetwell. This mechanism would also explain why the degradation occurred above the water line and on the ceiling of some of the wetwells. The presence of the slime may also have created an ideal environment for the bacteria to grow.

No problems with the application of the coal tar epoxy were noted during the investigation. It was applied at the recommended thickness and was tightly adhered to the concrete even when the concrete was attacked by the sulfuric acid. This was confirmed by the pieces of concrete that were found attached to the back of the failed coating.

It was recommended that the existing coating be removed and replaced. If the current acidic environment could not be stopped by some sort of process change, the existing coating system would have to be replaced with a more acid-resistant coating. The existing coating and degraded concrete were recommended to be removed by high-pressure waterjetting or open abrasive blasting.

Once the coating was removed, the

surfaces were to be thoroughly flushed to remove all acid that may have remained, and then tested for pH. Neutralization with an alkaline material such as a sodium hydroxide solution might be necessary if the pH of the surface cannot be brought up above neutral.

Once the surface is dry, areas of exposed aggregate should be primed and resurfaced with an epoxy fortified resurfacing material. One or two coats of an acid-resistant lining, such as an epoxy novolac, should be applied at around 60 mils DFT.

### a **SPY** for every mission

#### *Inspect Any Metal Surface Coating*

For pipes, tanks or any coated contoured surface in the field or inside your manufacturing facility, we simplify coating integrity testing with our full line of SPY® portable and permanent Holiday Detectors.

#### *SPY® Model 780, 785 and 790 Portable Holiday Detectors*

- New ergonomic design
- Pipe coating inspections up to 60"
- Extremely durable
- Infinite voltage setting on the fly

*Compact,  
lightweight  
wet sponge  
holiday  
detectors*

#### *SPY® Wet Sponge Portable Holiday Detectors*

- No belts, lightweight, fast set up
- Sponge roller speeds large flat surface area inspections
- Interchangeable flat or roller sponge

*Reliable continuous inspections  
on the assembly line*

#### *SPY® In-Plant Holiday Detector Systems*

- Custom designed to streamline manufacturing
- From pipecoating inspections to large flat surfaces

Volume discounts on detectors available through our distributors. 4% for 6 through 10 detectors; 6% for 11 or more-same order same shipment. (excludes Model 670)

# Work Plan: Use It or Lose It

By Joseph Brandon and Michael Damiano, SSPC: The Society for Protective Coatings

*Authors' Note: This article is the fifth in a series on contracting. We have discussed the value of project planning in references 1-4, with a different look at the value of project planning to each entity involved in a project. It is not the intent of this article to delve into the details of project planning; rather, we intend to address the results of project planning and how to use those results to improve project execution. While this article concerns only Work Plans, we continue to recommend that Work Plans and Corrective Action (CA) be used together because they are complementary tools for improving control over any type of project. A glossary is on p. 16 of this article.*

In this article, the term "Work Plan" means "detailed work procedures, including all alternative formats of detailed work procedures, such as Process Control Procedures (PCPs), Work Procedures, and Work Instructions." An owner can, in the contract, require the contractor to write and submit a Work Plan before starting the job. The Work Plan concept, available to the coating community for many years and in many formats, can be a valuable tool for facility owners or those who manage coating projects for the owner. Using the Work Plan can be especially valuable if the owner's contract administration staff is not expert in coatings. It may seem counterintuitive to require the coating contractor to submit detailed work procedures to contract administrators not expert in coatings, but as we will show, it is precisely in this context where the Work Plan is most valuable to the owner.

Here are two basic guidelines for owners.

- If you require a Work Plan submittal on each project, but you file it away, you are missing the value of this tool. You might as well eliminate the requirement and stop wasting both your and the contractor's time. The value of the Work Plan lies in its use as a living document throughout the project.
- If you don't use the Work Plan in your contracting, you are missing one of the more valuable tools that owners and contractors can use to improve both the contracting process and the finished product.

## Why Owners Should Require the Work Plan

There are many good reasons for requiring a contractor to document its work procedures in a Work Plan, but one reason stands out: "To ensure complete and effective communication of intents to everyone involved with the project." Simply verbalizing the procedures to managers, supervisors, and workers isn't enough. Why not?

Remember the campfire game where one person whispers a message to the next person and asks the person to pass it on? By the time the message has gone around the campfire circle, it is seldom the same message that the first person passed on. Players have inadvertently modified the message, sometimes as soon as the second person passes it on to the third.

What makes us think that verbal communication on a jobsite is likely to be any better than in the campfire game? When we add problems such as nuances in words (especially in technical terms), unqualified personnel, language barriers, and multiple tradespeople, it is easy to see that communication problems can happen and have a serious, negative impact on worker performance and on the project.

We know that contract documents contain many requirements, such as procedural and technical requirements, referenced requirements, and, on occasion, performance requirements. But the typical contract document package fails to provide for a clear understanding of the sequence of processes that will be employed on a project. Without such an understanding of the project, the contractor's staff has little knowledge on which to plan and prepare to get the work done cost effectively, within schedule and in accordance with requirements.

Likewise, without the details of the contractor's plan of action, the owner's staff has little knowledge upon which to review any submittals or to have any idea of the contractor's intended processes.

Further, project managers, superintendents, foremen, workers, inspectors, and suppliers are dependent upon others to provide suitable advance notification of work to be accomplished. The Work Plan should be a living, multi-purpose document that is constantly revised to show the latest approved and verified procedures. It should be used for training and indoctrination before performing the work. The Work Plan also gives the objective evidence of the procedures that were to be used on the project, in case any

questions arise later concerning the condition of the finished product.

### **What the Contractor Should Include in the Work Plan**

While the owner's specification details the requirements for the end product, the spec leaves, by design, many important decisions up to the contractor, and the Work Plan is contingent on these decisions. They may include but are not limited to

- selection of materials,
- selection of equipment used for surface preparation and application,
- order of work progression,
- use of shop as well as field procedures, and
- a myriad of controls to ensure conformity to specification requirements.

Until the contractor makes these decisions, it will not be possible to prepare project-specific procedures, such as

- health, safety, and environmental compliance plans;
- confined space entry plans;
- procurement of the necessary materials;
- procurement of the necessary job site and support equipment;
- assigning the management team for the project;
- obtaining the craft workers with the necessary skills;
- mobilization of all of the above;
- inspection and test plans; and
- worker training and PPE.

After the contractor has made all of the necessary decisions about how to execute the project, the details must be communicated to all key people, including but not only

- owner/engineers,
- project planners/managers,

- industrial hygienists,
- schedulers,
- purchasers,
- superintendents,
- foremen,
- workers, and
- QC/QA inspectors.

The best way to effectively communicate project decisions is through use of written, detailed procedures that can be understood by all involved in the process and that relate the following types of information.

- Complete identification of the process (e.g., surface preparation, application, and cure)
- Description of how the process is to be performed, particularly critical factors that will affect the process quality, safety, and ability to meet scheduling demands
- Identification of hazardous materials to be used or wastes to be generated and methods to address them
- Qualification requirements for personnel conducting the process
- Methods for quality control of the product produced by the process
- Inspection and documentation forms for recording quality control data that the owner needs for quality assurance of the process, including acceptance criteria

Thus, the contractor's Work Plan must translate the "what to do" requirements of the specification into an efficient "how to do it" set of instructions for craftsmen to follow, from the initiation of project work to its satisfactory completion. So for each coatings project, the contractor must prepare written procedures for all of the actions required for its workers to meet the specification. These actions must be assembled in a logical sequence to minimize the time (cost) required.

# Work Plan: Use It or Lose It

To achieve this goal cost-effectively, the documented procedures must comprehensively address all worker requirements. The Work Plan must be written in clear language, and it must be targeted to the specific production crew to ensure complete comprehension. The contractor can determine the appropriate level of detail by describing what

must be provided to a field crew to achieve the required product the first time, every time; inspected for verification; and documented.

## How Owners Can Use the Work Plan

Every contracting agency constantly looks for ways to discourage contractors that are not intent upon fulfilling con-

tract obligations. While we have put forth numerous thoughts on improving contracting, consistent and complete use of the Work Plan is one of the most powerful changes that any contracting agency can make to encourage good performers and to achieve desired results.

The owner should require that all work, inspection, and documentation be accomplished according to approved, verified procedures of the Work Plan. The Work Plan, as with all submittals, should be approved by the contractor and submitted to the owner for information and record purposes. The owner should retain rights in the specifications to review all submittals and to take appropriate action, such as making comments on proposed processes or requiring changes to the Work Plan at any time during the project. The owner should avoid getting into the position of approving or disapproving the Work Plan, or other submittals because "owner approval" might motivate the contractor to plan to do what the owner will accept instead of what the contract documents require.

The key to using the Work Plan effectively is to establish requirements where the contractor shall do the following.

- Prepare the Work Plan submittal that outlines all of the contract requirements, industry best practices, and all other relevant issues
- Require that its QC manager (and an optional Certified Protective Coating Specialist (PCS) on the QMS staff) approve the Work Plan and all other submittals
- Verify that the procedures will produce conforming work before production begins
- Have qualified inspectors (owner-specified qualifications) to inspect and document work
- Submit all change requests through the established submittal process described in the contract

## Glossary

- **Corrective Action (CA):** correction of a nonconformity (defined below), with action to identify and eliminate the root cause of a detected nonconformity. (Brandon and Damiano, March 2008 *JPCL*, p. 29)
- **Log:** a record of dated performance, events, or day-to-day activities
- **Nonconformity or non-conforming work:** interim or final work that fails to fulfill contract requirements and requires rework or repair, or must be scrapped. (Brandon and Damiano, August 2007 *JPCL*, p. 50)
- **Process Control Procedure (PCP):** a written plan prepared for each sub-process, or for multiple processes at specific locations. Sub-processes in painting operations include but are not limited to mobilization, abrasive blast cleaning, coating mixing, coating application and curing, and clean-up, inspection.
- **Quality Assurance (QA):** all of the actions required by the owner to ensure contractor conformity to requirements. This can include any combination of inspection of the work and monitoring/auditing of the contractor's objective evidence of conformity. Quality assurance is performed as the work progresses, and the results are used to address nonconformities in either the work or the Quality Management System (defined below), and to assist in approving invoices and accepting work. (Brandon and Damiano, August 2007 *JPCL*, p. 50)
- **Quality Control (QC):** "performing the necessary observations, testing, and documentation to verify that work performed meets or exceeds the minimum standards established by the project specifications or contract. QC is the contractor's responsibility." (Kaelin, April 2005 *JPCL*, p. 59)
- **Quality Management System (QMS):** a system of general or specific policies and procedures to improve and control the various processes that will ultimately lead to improved business performance. (Brandon and Damiano, August 2007 *JPCL*, p. 50)
- **Work Instruction:** "a documented process for quality activities that are intra-departmental. The intent of the work instructions [is] to be used as a reference where they will provide guidance and consistency when employees perform specific quality related tasks within a department." "Work instructions are not as general as procedures and are very task specific. They should tell how to do or use something." (for purposes of complying with ISO or QS 9001)\*
- **Work Procedure:** "a documented process for quality activities that are inter-departmental. The intent of the procedures are to be used as a reference where they will provide guidance and consistency when employees perform quality related tasks." (for purposes of complying with ISO or QS 9001)\*

\*[http://www.flowhelp.com/writing/procedure\\_writing.html#Procedure](http://www.flowhelp.com/writing/procedure_writing.html#Procedure)

- Revise the Work Plan as required to maintain continuous, verified procedures (no work without contractor-approved, verified procedures)
- Inspect to the approved Work Plan
- Document conformity of work to the Work Plan (following the detailed procedures) and to contract requirements

### Formats for Work Plans

The intent of detailed procedures that constitute the Work Plan is to provide the correct and complete information to those that need it, especially those performing the work. The ultimate goal of the Plan is to provide conforming work the first time, every time. The types of information in Work Plans are essentially the same, but the formats may differ to accommodate owner requirements, functionality of the procedures, etc.

To understand the difference between Work Plans and PCPs, think of the entire coating operation as a process, and the various subcomponents of the operation, such as mobilization, abrasive blast cleaning, coating mixing, coating application and curing, cleanup, and inspection, as sub-processes. A Work Plan is written for the entire process of preparing and coating the entire structure while a PCP

is prepared for each sub-process, or for multiple processes at specific locations. Functionally, Work Plans and PCPs accomplish the same goal of detailing production of a complete and conforming product, with controls, inspections and tests, and documentation.

PCPs are common in shipyards and are likely useful in operating plants, refineries, and other facilities where work is done piecemeal and must be coordinated daily with the owner and other trades. Work Plans are more common where the entire site is turned over to the contractor for complete work on the contractor's schedule. The format, i.e., Work Plan vs. PCP, is the contractor's choice, unless specified in the contract documents. In general, the format is less critical than the accuracy and completeness of the procedures. The important factor is functionality.

The contractor's Work Plan should be consistent with its project-specific quality plan. To avoid confusion in the field, project managers should make sure that there is no repetition of procedures in either document. However, it is quite reasonable and customary to cross-reference documented procedures where necessary.

The contractor's Work Plan also provides important information to the owner and is subject to owner review. The Work Plan provides the owner with the assurance that the project has been well-planned and can be accomplished.

### Documentation

Forms used to document all the project-specific QC data should be customized for each project. To develop the appropriate inspection forms, the contractor must

- collect contract requirements from contract documents, referenced documents, and referenced documents in referenced documents;
- develop an Inspection & Test Plan (I & TP) and I & TP Log to match requirements; and
- develop inspection forms, to include requirements, acceptance/rejection criteria, measurement of observations, assessment of conformity (Yes/No), and tracking of transfer of nonconformities to the Nonconformity Log and the CA Log.

The sequence needs to address scheduling of the work in days, plans to conform to recoat and extended recoat windows, and the impact of any required

## Overspray Problems? We Have the Solution!

**DAMAGE CONTROL:** Costs are lowered, as much as 75%, through our fast, professional on-site overspray removal service.

**COMPETITIVE PRICING:** No charges, other than those for cleaning vehicles. Experience: Forty-four years of experience in removing: paint, epoxies, urethanes, roofing foam, asphalt, tar, concrete, industrial fallout, and most other contaminants, from all types of vehicles, boats, and aircraft.

**STATE-OF-THE ART TECHNOLOGY:** Our unique rubber pad eraser eliminates the use of: solvents, razor blades, buffing machines, sandpaper, rubbing compounds, and clay products.

**IMMEDIATE ACTION:** Skilled and uniformed technicians are quickly mobilized to any overspray claim site in the nation.

**COMPLETE DOCUMENTATION:** Signed pre-inspection forms and releases from satisfied claimants, that limit liability issues, along with vehicle photos.

*Overspray Removal Specialists, Inc.*

**800-835-5858**

**www.sprayclaims.com**

Click our Reader e-Card at [paintsquare.com/ie](http://paintsquare.com/ie)

rework on scheduling and phasing. Since rework will require approved procedures, such procedures should be included in the approved Work Plan to be available on short notice if needed. The contractor needs to identify QC scheduling as part of the work sequence to make sure the inspections get done and to avoid delays.

The contractor's procedures must provide enough information to ensure that use of these procedures by the production crew will result in conforming work. This assurance must not only cover the quality of the procedures but also adequately address health, safety, work coordination, scheduling, etc. The Work Plan should drive the safety plan, the confined space entry plan, the I & TP, and any hazardous material and hazardous waste management plan. Only after the Work Plan contains all significant operational details can documents such as the I & TP, safety plan, and confined space entry plan be completed. All of these fit together into a package of instructions and guidance on all actions on the jobsite, and should be maintained as continuous working documents.

## Added Value for Owners

Project Managers from the best coating contractors know that preparing detailed procedures requires significant time, but it is time well spent. Good procedures will result in more efficient work production and thus a cost savings to the contractor. Owners want to hire prepared contractors. The Work Plan also provides a link to the contractor's processes in the event that a problem arises with the intermediate or finished product. In the Federal marketplace where acceptance is final except for latent defects, fraud, and gross mistakes amounting to fraud, the Work Plan and I & TP are invaluable in protecting the government's rights to make claims under one or more of these exceptions.

The Work Plan drives planning, and, as a result, will help avoid many disputes, by requiring conflicts, discrepancies, and other issues to be identified early in the process to make the necessary adjustments before project start-up. When the contractor fails to produce only conforming work for any reason other than encountering a condition that could not have been known, it indicates a failure of the contractor's Quality Management System (QMS).

The most powerful benefit of the Work Plan is somewhat more obscure, and even when this value is considered alone, the Work Plan creates such value for the owner that no contract should be executed without it. Almost universally, contractors that do not intend to perform satisfactorily do not want their work traced to documented procedures because this documentation is available in perpetuity to be reviewed for flaws. Thus, consistent use of the Work Plan will discourage those contractors that do not intend to perform satisfactorily and do not have in place all of the knowledge and capabilities to plan and follow through to produce only conforming work.

This just may be that magic formula that many owners have been looking for. Here is the opportunity to eliminate those contractors that do not plan, and to award contracts only to contractors with the capability to plan, prepare, and produce conforming work—cost effectively and without avoidable accidents. Using artificial means of limiting contractors almost always has negative repercussions. Using the Work Plan can solve this problem and simultaneously give the owner much better legal protection in the case of premature failure.

## Value to the Owner's Non-technical Staff

Whenever owners require the contractor to have a QMS, all submittals should be designated for contractor QMS approval, and the owner should retain rights in the

contract to review and take appropriate action on all submittals. The requirements for the contractor to approve all submittals removes much of the back and forth that is common in submittals where the contractor is trying to find what the owner will accept, rather than what the contract documents require. This provides for a more complete documentation trail, and, in most cases, will result in more complete planning and preparation by removing the issue of "what will the owner accept" from the planning equation.

The non-technical contract administrator and other staff can have confidence that the fully documented trail of planning and preparation will provide a level of incentive for the contractor to plan and prepare. This incentive is less likely when the Work Plan is not required.

Requiring a Work Plan also increases the likelihood that project documentation will be complete and accurate. Understanding that the Work Plan is a traceable document, the contractor will not want to document incomplete plans and preparations, and neither the contractor nor the inspector will want to take a chance on falsifying documentation.

Project planning is normally the contractor's domain. Most owners seem to stay out of this area for fear of directing the contractor to perform tasks a certain way. This fear may well have caused those owners to avoid the Work Plan. However, when using it in the manner described here, the owner can stay at arm's length from project planning while being assured that appropriate project planning will be accomplished and can have documentation of those planning results upon which to refer for information and quality assurance purposes.

## Summary

Every contracting agency constantly looks for the magic formula to achieve desired results. Consistent and com-

plete use of the Work Plan can do just that and is most valuable when the contract administration staff is not expert in the work being accomplished.

A Work Plan that provides all of the details of the proposed execution, inspection and testing, and documentation is necessary for every project if there is to be any confidence in the work being performed in a complete and conforming manner, with minimal opportunities for latent defects.

When used as a continuous planning tool, the Work Plan is invaluable; when used as a one-time submittal, it has little or no value and should be eliminated.

## SSPC Attends Historic UDOT Bridge Move

**O**n March 26, 2011, SSPC Executive Director Bill Shoup, along with a crowd of about 1,000 people, witnessed the Utah Department of Transportation (UDOT) make history.

As part of the \$1.7 billion I-15 CORE

project, UDOT lifted the 3.8-million-pound, 354-foot-long Sam White Bridge and used self-propelled modular transporters (SPMT) to move the bridge several hundred feet.

It is the longest two-span bridge ever to be moved by SPMT in the Western

Hemisphere, according to UDOT. The bridge was UDOT's 23rd successful SPMT bridge move.

For photos of the move and a link to more information, including a time-lapse video of the move, visit the News section of [www.sspc.org](http://www.sspc.org).

### SSPC 2011 Conference Training and Certification Wrap-Up

Two hundred of the industry's top coatings professionals attended SSPC's training and certification programs held in conjunction with the SSPC 2011 featuring GreenCOAT show in Las Vegas, NV. The show took place from January 31 to February 3, 2011.

The focus of the training/certification programs was to provide the attendees with the necessary knowledge and resources for the protective coatings industry.

The attendees included contractors, consultants, inspectors, engineers, paint and equipment manufacturers, and structure and facility owners.

SSPC's programs are affordable, high-quality learning opportunities. Every program currently offered requires six days or less to complete, minimizing

time away from the job.

The training/certification programs that were featured at SSPC 2011 are listed below, along with the instructor(s) and number of students that attended.

- Applicator Train-the-Trainer (ATT); Tom Jones and Rick Smith; 13 students
- Concrete Coating Inspector Program (CCI); Bob Murphy; 7 students
- Basics of Estimating Industrial Coatings Projects; Stephen Dobrosielski; 12 students
- Bridge Coating Inspector Certification (BCI); Ernst Toussaint and Greg Hinkle; 10 students
- Evaluating Common Coating Contract Clauses; Ralph Trallo; 4 students
- Fundamentals of Protective Coatings (C-1); Luke Clark; 5 students
- Lead Paint Removal (C-3); Chris Lovelace and Mitch; 22 students

*Twenty-eight students attended SSPC QCS in Las Vegas earlier this year.*

*Ten students attended the Bridge Coating Inspector Certification program at SSPC 2011.*

*Protective Coatings Paperless QA and Digital Data Collection had 17 students.*

*Students of the Project Management course. Nolan Rubus from F.D. Thomas, Inc., said, "This Project Management course was well-rounded and hit all the major points of a project manager's role. The concepts and ideas presented were universal enough to be applied to the construction industry as a whole, which is very valuable."*

- Lead Paint Removal Refresher (C-5); Lloyd Smith; 34 students
- Project Management for the Industrial Painting Industry; Ralph Trallo; 11 students
- Protective Coatings Exam (PCS); N/A; 13 students
- Protective Coatings Inspector Certification (PCI); Bill Corbett and David Hunter; 24 students
- Protective Coatings Paperless QA and Digital Data Collection; Joe Walker and Heather Stiner; 17 students
- Quality Control Supervisor Course (QCS); Tom Jones and Charley Harvilicz; 28 students
- Specifying and Project Management (C-2); Troy Fraebel; 5 students

*Students of the Concrete Coating Inspector program. "The CCI program is just another step in my professional development, which includes varied industries and materials," said Tim Williams, Braun Intertec Engineering, Inc.*

The SSPC training and certification programs will be back in full force at SSPC 2012 featuring GreenCOAT, which will take place in Tampa, FL, on Jan. 30 to Feb. 2, 2012.

Visit [www.sspc.org](http://www.sspc.org) for training and certification programs scheduled throughout the year.

### Thermal Spray Review Invites Participants

SSPC is inviting interested stakeholders to participate in the review of SSPC CS 23.00/AWS C2.23/NACE No. 12, "Specification for the Application of Thermal Spray Coatings (Metallizing) of Aluminum, Zinc, and Their Alloys and Composites for the Corrosion Protection of Steel."

The standard was first issued in 2003 and contains requirements for equipment, application procedures, and in-process quality control (QC) checkpoints.

Anyone interested in participating in the review should contact Aimée Beggs, SSPC Standards Development Specialist, at 412-281-2331 ext. 2223 or [beggs@sspc.org](mailto:beggs@sspc.org).

### Donations Exceeding Expectations

Since SSPC began the Japan Chapter Relief Campaign, donations have exceeded expectations. The \$5,000 goal that the Board had decided to match has already been met.

To continue to donate to the fund, visit the SSPC Marketplace on [www.sspc.org](http://www.sspc.org).

## Total Containment Systems, L.P.

*Respectability & Dependability Since 1993*

Talk with companies who have used the TCS patented platform. Ask them the tough questions: "Does the TCS platform save on labor costs and does it increase productivity as much as they say? How responsive and professional are they? Does TCS care about the success of your project? If you had to do it again, would you choose the TCS platform?" We think you will be impressed with the positive responses.

We look forward to the opportunity to demonstrate our quality "state of the art" working platform and debris shielding systems. No other system available in today's marketplace offers contractors as much versatility and cost effectiveness. One platform serves a variety of functions and allows you to concentrate on the most important items of your business; ...

*Students of the Concrete Coating Inspector program. "The CCI program is just another step in my professional development, which includes varied industries and materials," said Tim Williams, Braun Intertec Engineering, Inc.*

The SSPC training and certification programs will be back in full force at SSPC 2012 featuring GreenCOAT, which will take place in Tampa, FL, on Jan. 30 to Feb. 2, 2012.

Visit [www.sspc.org](http://www.sspc.org) for training and certification programs scheduled throughout the year.

### Thermal Spray Review Invites Participants

SSPC is inviting interested stakeholders to participate in the review of SSPC CS 23.00/AWS C2.23/NACE No. 12, "Specification for the Application of Thermal Spray Coatings (Metallizing) of Aluminum, Zinc, and Their Alloys and Composites for the Corrosion Protection of Steel."

The standard was first issued in 2003 and contains requirements for equipment, application procedures, and in-process quality control (QC) checkpoints.

Anyone interested in participating in the review should contact Aimée Beggs, SSPC Standards Development Specialist, at 412-281-2331 ext. 2223 or [beggs@sspc.org](mailto:beggs@sspc.org).

### Donations Exceeding Expectations

Since SSPC began the Japan Chapter Relief Campaign, donations have exceeded expectations. The \$5,000 goal that the Board had decided to match has already been met.

To continue to donate to the fund, visit the SSPC Marketplace on [www.sspc.org](http://www.sspc.org).

## Total Containment Systems, L.P.

*Respectability & Dependability Since 1993*

Talk with companies who have used the TCS patented platform. Ask them the tough questions: "Does the TCS platform save on labor costs and does it increase productivity as much as they say? How responsive and professional are they? Does TCS care about the success of your project? If you had to do it again, would you choose the TCS platform?" We think you will be impressed with the positive responses.

We look forward to the opportunity to demonstrate our quality "state of the art" working platform and debris shielding systems. No other system available in today's marketplace offers contractors as much versatility and cost effectiveness. One platform serves a variety of functions and allows you to concentrate on the most important items of your business; ...

# Long Painting to Recoat Spillgate at Gorge Dam

**L**ong Painting Company (Kent, WA) was awarded a contract by Seattle City Light to perform coatings application and seal rehabilitation on the two 47-foot-wide by 50.5-foot-high steel spillgates at the Gorge Dam on the Skagit River. The existing lead-bearing coatings are the original system from 1961 when the dam was built. The project includes abrasive blast cleaning upstream gate surfaces to a Near-White finish (SSPC-SP 10) and waterjetting downstream surfaces (SSPC-SP 12) prior to applying a moisture-cured urethane system. The contract, which required SSPC-QP 2 certification, is valued at \$440,843.79.

*Photo courtesy of HDR Engineering*

### Akira Yamamoto Wins Reservoir Painting Project

Akira Yamamoto Painting, Inc. (Honolulu, HI) secured a contract of \$246,650 from the City and County of Honolulu to repair and recoat exterior surfaces at five reservoir sites, including reservoir walls, parapets, piping, steps, shelters, pump stations, a dome roof, and various appurtenances. The reservoir walls will be repaired and coated with a crystalline capillary waterproofing system prior to finish coating. All of the designated surfaces will be refinished with an acrylic system. The contract also includes lead-based paint abatement.

### Jeffco Awarded WWTP Coating Contract

Jeffco Painting & Coating, Inc. (Vallejo, CA), SSPC-QP 1- and QP 2-certified, was awarded a contract of \$162,100 by the city of Brentwood, CA, to perform

corrosion control work at a wastewater treatment plant. The project includes abrasive blast cleaning and recoating various metal infrastructure, including secondary clarifier and grit separator surfaces. The contract includes applying high-build epoxy to immersion service areas and an epoxy-polyurethane system to exposed surfaces.

### Fleischer's to Recoat Pista Grit System

Fleischer's, Inc. (West Palm Beach, FL) won a contract of \$24,343 from the city of Fort Pierce, FL, to recoat a Smith & Loveless Pista grit removal unit at a water reclamation facility. The equipment has been in service since 1958. The project involves applying glass flake-reinforced epoxy systems on the interior of the steel tank and walkway framing, an epoxy system on exterior tank surfaces, and an acrylic coating on the concrete base.

*Continued*

## Pull-Off Adhesion Webinar Slated for July

An SSPC/JPCL webinar, "Pull-Off Adhesion Testing," will be presented by David Beamish of DeFelsko on July 13, 2011 from 11:00 a.m. to Noon, Eastern Time.

The webinar, presented at a basic level, will explain how to perform an adhesion pull-off test according to ASTM D 4541 and will review the variables that can affect test results.

Free registration for the webinar is available online at [www.paintsquare.com/education](http://www.paintsquare.com/education).

## Project Preview

### Spring DOT Update

State Departments of Transportation have recently awarded numerous contracts for bridge painting, as well as related supplies and services.

Euro Paint, LLC (Lowellville, OH) secured a contract of \$787,500 from the Wisconsin DOT to recoat 87,500 square feet of steel on a 5-span, 626-foot-long girder bridge over the Chippewa River.

Watson Coatings, Inc. (St. Louis, MO) signed a \$15,350 agreement with the Arkansas Highway and Transportation Department to supply 144 5-gallon containers of calcium sulfonate alkyd coatings for maintenance painting of marginally prepared steel surfaces.

The Massachusetts DOT awarded a contract of \$1,262,992.50 to Prime Coatings, Inc. (Salisbury, MA), SSPC-QP 1- and QP 2-certified, to perform lead abatement and coatings application on two steel bridges over Interstate 93.

KTA-Tator, Inc. (Pittsburgh, PA), SSPC-QP 5-certified, signed a cost plus fixed fee contract with the Illinois DOT to perform coatings inspection services on bridge painting projects in District 1. The contract requires NACE Level 3 certified inspectors.

Spartan Contracting (Campbell, OH), SSPC-QP 1- and QP 2-certified, secured a \$1,890,000 contract from the Kentucky Transportation Cabinet to recoat a 12-span, 1,472-foot-long steel beam bridge over the Green River.

The Virginia DOT awarded two bridge painting projects, including a \$1,299,000 contract with Atlas Painting & Sheeting Corp. (Amherst, NY) to recoat 736 tons of steel on three bridges and a \$1,273,240 contract with Saffo Contractors, Inc. (Leland, NC) to

recoat 1,008 tons of steel on four bridges. Both contracts include lead-based paint abatement. Both companies are SSPC-QP 1- and QP 2-certified.

Pacific Painting Company, Inc. (Munster, IN)

won a contract of \$147,933 from the North Dakota DOT to recoat 11,900 square feet of steel on a 6-span, 262-foot-long steel bridge. The contract required SSPC-QP 1 and QP 2 certification.

# 2011 Annual Equipment Buying Guide

**T**he 2011 Equipment Buying Guide lists equipment and related supplies for protective and marine coating work from more than 450 manufacturers, distributors, and rental companies. The purpose of the Guide is to help users identify sources of equipment and supplies for protective and marine coatings operations.

The Guide is divided into eight categories, and the types of products within each category are listed alphabetically. On p. 30, you will find the Table of Contents, which you can use to look up generic products and equipment by any of eight general categories: Access; Application; Climate Control; Environmental Protection; Inspection; Laboratory Testing; Safety; and Surface Preparation. Within each category, appropriate products are listed alphabetically.

On p. 31, you will find the Index to the Buying Guide, which you can use to look up generic products and equip-

ment on a single alphabetized list. To contact companies about their products, consult the Equipment Company Profiles, which begin on p. 102.

In the Guide itself, which begins on p. 32, companies either displayed in boldface type or accompanied by boxed display ads have paid an advertising fee. Otherwise, a company's information appears free of charge.

The Guide is based on data obtained through a survey sent in March 2011 to manufacturers, distributors, and rental companies known to *JPCL*. The print edition of the *JPCL* Guide includes the companies that completed the survey by the deadline for the June 2011 issue. The Guide is also published at [www.paintsquare.com](http://www.paintsquare.com), the online home of *JPCL*.

The online edition of the Buying Guide is updated throughout the year, so persons who would like their companies to be included should contact Anita Socci at [asocci@protectivecoatings.com](mailto:asocci@protectivecoatings.com).

## ATTENTION Coating Manufacturers!

Don't miss your chance to list your coating products by brand name and for **FREE** in the JPCL October 2011 Coating Systems Buying Guide, also to appear on PaintSquare. Instructions for submitting your form online will be emailed in July to coating manufacturers known to JPCL.

Contact Anita Socci at 1-800-837-8303, ext. 136; [asocci@protectivecoatings.com](mailto:asocci@protectivecoatings.com) to make sure your company is included on our email solicitation list.

## The CAM® Gauge Rake

A Midwest Rake Company Original

Frames come with a milled threaded handle adapter or a 66" powder-coated aluminum handle

Each CAM® has multiple contact points of the same depth

CAM® Sets Sold Separately

CAM® sets are available in depth settings ranging from 1/32" to 1-1/2"

A patented "goof-proof" tool that spreads decorative concrete toppings and high performance floor coating materials at a precise and uniform specified depth... saving time and money while reducing applicator error.

Take a look at us...

[www.midwestrake.com](http://www.midwestrake.com)

it's worth the trip.

We also offer...

- Notched Squeegee
- Spiked Shoes
- "Flex-Bed" Spiked Shoes
- Spiked Rollers
- Cove Trowels and more...
- Smoothers
- Gauge Rakes
- Roller Covers and Frames

## VINYL ESTER SOLUTIONS

### Compliance, Performance and Productivity Advantages with Binks

*Ideal for Vinyl Ester Applications  
Requiring 0.5% - 3.5% Catalyst Ratios*

**Binks Vinyl Ester  
Spray Finishing outfits  
provide what industry  
needs today:**

**Increased** production with supply capacity of 3.4 GPM (12.9 l/m) at 60 cycles/min of resin

**Accurate** volumetric ratio due to coupled catalyst and resin pump

**Savings** on time and material — flushing eliminated with Binks Century HVLP vinyl ester spray gun

**Excellent** transfer efficiency

**Compliance** with many environmental regulations using HVLP technology

**Complete** pumping system, 37:1 ratio, 2960 psi (204 bar) in a cart-mount setup including Binks Century HVLP vinyl ester spray gun with dual acting trigger lock; 50ft each of air, catalyst and material hose assemblies; plus 55 gal. siphon hose assembly

## Excessive Humidity?

### It's under control

With over fifty years of combined experience, **DH Tech** brings the best value in temporary climate control to the coatings industry. Innovative and resourceful approaches result in the most effective and economical solutions to humidity and temperature control. Manufactured in our Houston facility, **DH Tech** offers the most compact, durable and portable dehumidification, heating and cooling equipment available today. Our trained and qualified service team adds reliability and 24/7 response.

With **DH Tech** people and equipment on the job,  
*it's under control.*

- Desiccant Dehumidification
- Cooling/Heating
- Application Design

## COATINGS & CONSTRUCTION DRYING

# Control Dew Point

with **ARID-Dry™** Accelerated Desiccant Drying

Temporary dehumidification can eliminate surface condensation and corrosion allowing contractors to work in the most extreme conditions. Dew point control also provides better conditions for proper bonding and curing. The **ARID-Dry** system combines the science of desiccant dehumidifiers with optional heating or cooling to maintain optimum conditions. Units are available in trailer or skid mounted configurations from 600 to 27,500 CFM.

**For equipment sales and financing call 810.229.7900.**

## Response, Reliability and Results for Industrial Coating and Maintenance Projects

When you need to hold the blast at the lowest possible cost, look to the HCU™ Dehumidifier and PowerPurge™ technology from Polygon.

The HCU's revolutionary design combines a desiccant dehumidifier with cooling. At the same time, the HCU recycles the system's waste heat to reactivate its desiccant wheel. The result of this patented engineering breakthrough is an extremely low dew point, cooler working conditions, and energy consumption reduced 40%. That means you'll work faster, avoid coating failures and cut thousands of dollars from fuel costs. PowerPurge technology reduces the energy required for reactivation while also reducing the discharge temperature of the process air, resulting in lower energy costs for post cooling.

## Containment Tarps & Screens for Every Need

All painting and blasting contractors know how important reliability is to project success. So consider the 30 years of containment experience at Indian Valley Industries. We've got the specification know how and manufacturing processes that get you the containment tarps you're looking for.

Whether your project is large or small, we fabricate each tarp and screen with quality and efficiency, getting you what you need when you need it. We stock a wide range of fabrics that will meet or exceed your specification — impermeable, impenetrable, and permeable with or without fire resistance.

custom sizes at stock size pricing - fast turnaround

### TQC DEWCHECK 4 DEWPOINT METER

- Measure and record relevant climatic parameters during paint jobs

### TQC BRESLE KIT

- Indicate the contamination of soluble salts on blast-cleaned surfaces prior to coating.

### TQC DUST TEST KIT

- Assess the quantity and size of dust particles on blast cleaned surfaces.

# CO OUT!

**Unique, patented low temperature catalyst purifies compressed breathing air.**

- for continuous use to remove carbon monoxide
- no expensive desiccant drying equipment needed
- helps provide comfortable, humidified compressed air to meet Grade-D requirements
- by far, the most economical CO-removal alternative

**Portable CO removal units from 8 SCFM to 50 SCFM; fixed systems up to 1000 SCFM.**

**“Save your breath with”**

## Creating Industry Experts

## the protective coatings paperless qa and digital data collection training course

Elcometer Instruments and SSPC are pleased to offer a course developed by Elcometer and administered by SSPC that focuses on coupling digital instrumentation with purely paperless inspection reporting.

This course emphasizes the benefits of incorporating industry standards, while maximizing the instruments' capabilities and potential to perform the most common daily inspection tasks. It also focuses on the importance of proper inspection reporting and the successful integration of a paperless quality assurance inspection program to significantly reduce the man hours incurred in the inspection process and the introduction of human error.

## upcoming 2011 dates

September 13-14, England • October 3-4, Port Orchard, WA • November 15-16, Hawaii

## THE US NAVY SAYS "YES!" TO BLASTING WITH DUSTNET®. SHOULDN'T YOU?

**SEE WHAT YOU'RE MISSING WITH DUSTNET® dust suppressant.** The Navy saw it when they blasted the USS Tennessee, and no matter what you're blasting, you will, too.

- Reduces respirable dust up to 97% and visible dust up to 76% during blasting
- Does not affect adhesion of coatings
- Increases productivity up to 65%

For test data, or to find the DUSTNET abrasives dealer nearest you, call Don Presley at 850-380-6214.

# BARTON

## Garnet - The Blasting Abrasive of Choice

### Nature's Low Dust Abrasive

- Minimizes safety risk
- Improves jobsite visibility
- No silica or heavy metals content worries

### More Durable than other Blasting Abrasives

- Cuts faster, works harder
- Optimizes surface preparation
- Recyclable

### CARB and Mil Spec Grades Available

Barton Mines Company, LLC

# GRITTAL

**The Smart Alternative  
to Mineral Abrasives in Surface Preparation.**

- **Martensitic stainless steel grit abrasive - 62 HRC**
- **Excellent durability**  
- approximately 30 times greater than aluminum oxide  
- approximately 75 times greater than garnet
- **Virtually dust-free environment leading to higher performance and increased blasting quality due to better visibility**
- **Reduced wear on nozzles and other air blast system components**
- **Can be used in centrifugal wheel machine application**
- **Consistent surface roughness profile resulting in optimum coating adhesion**
- **Minimal waste disposal**
- **Reduction of overall blasting costs**

## #1 In Steel Tank Cleaning Equipment

Our new BP-505 is a horizontal steel shot blasting machine that is ideal for cleaning the floors and roofs of oil storage tanks and ship decks. The BP-505 features modular construction that allows the machine to be dismantled to fit through a 24" manhole and also features independent electric drives for each wheel for easier handling.

# EcoQuip®

## WET ABRASIVE BLAST SYSTEM

- Eliminates 95% of Airborne Particles  
~Lowering containment costs
- Minimal Media Consumption  
~50-200lbs per hour, without production loss  
~Reducing clean-up, transport, and disposal costs
- Stripping Rate Consistent with Conventional Blasting  
~Removes high performance coatings and linings
- Performs with Any Media Heavier than Water
- Complete Mobile and Stand-Alone Units Available
- Top-Tier Distributor Network  
~Represented by the top abrasive blast companies
- Built with the Highest Quality Heavy Duty Components  
~ Including Axxiom Galvanized Pots  
~ Stainless steel crash frame, control panel and plumbing

# Get a better handle on surface prep

*The compact SRT-6LT  
weighs just 20 lbs.*

NLB's semi-automated VertaJet™ lets you do surface prep more productively than manual water jetting, with less effort. The lightweight SRT-6LT has ergonomic handles and 40,000 psi rotating jets with a 6" cleaning path.

The SRT-6LT quickly removes coatings, epoxies, rust, and more from steel and other substrates. The nozzles need no air to rotate and get into corners better than ever before. Vacuum recovery of water and debris is standard.

The VertaJet is as reliable and environmentally-friendly as it is productive. For details, call NLB today, or visit our website.

# YOU KNOW IT WHEN YOU SEE IT.

**No flash rust = a clean surface.**

**HoldTight® 102** is the standard of performance for preventing flash rust:

- **No salt.** Removes **all** contaminants
- **No rust.** Leaves a rust-free surface for 48 hours or more – often 3 to 5 days
- **No detectable residue.** There is nothing left on the surface that might interfere with your coating.

Among rust preventers and salt removers, HoldTight® 102 is the most widely used, reliable, time-proven, lab-tested, field-tested, recommended and approved by coating companies.

Call today to see why HoldTight® 102 is the best option for low-cost, easy-to-achieve, and easy-to-measure contaminant-free surface preparation.

## A History of Access Advantages You can Count on Today.

In today's competitive market, Safway's versatile QuikDeck™ Suspended Access System provides the access advantage you need for bridges, buildings and other structures.

- Easy Installation
- Modular platforms to reduce labor cost
- Can be "leapfrogged" to reduce equipment cost
- Professional engineering support and crew training
- Safe to the environment

Since 1936, Safway has been a leader in scaffolding and access solutions. With extensive in-house engineering, robust project management and award-winning safety excellence, Safway provides cost-effective solutions you can count on every day.

## 2011 WJTA-IMCA CONFERENCE & EXPO

**Monday-Wednesday, September 19-21, 2011**  
**George R. Brown Convention Center, Houston, Texas**

**Network with professionals from around the world at the WaterJet Technology Association (WJTA) and the Industrial & Municipal Cleaning Association (IMCA) 2011 Conference & Expo. The 2011 WJTA-IMCA Conference and Expo is dedicated to high pressure water-jet technology and related services:**

- Industrial and Municipal Cleaning and Maintenance Services
- Wet and Dry Vacuum Services
- Surface Preparation
- Paint and Coating Removal
- Hydrodemolition
- Precision Cutting
- Hydro-Excavation

**Preliminary Program:**

- Live Demonstrations
- New High-Tech Product and Equipment Displays
- Boot Camp Sessions for Contractors and End Users
- Waterjet Technology: Basics and Beyond Pre-Conference Workshop
- Understanding the Power of Vacuum and How Industrial Vacuum Loaders Work (two-hour course)
- Emerging Technology: New Applications: Hear some of the world's leading engineers and researchers share new developments in applications, mechanics, equipment, and procedures.

For more information, or an application for exhibit space, visit [www.wjta.org](http://www.wjta.org)  
**Tel: (314) 241-1445, Email: [wjta-imca@wjta.org](mailto:wjta-imca@wjta.org)**  
 Mailing Address: 906 Olive Street, Suite 1200, St. Louis, MO 63101-1448.
