

The Voice of SSPC: The Society for Protective Coatings

FEATURES

22 Training and Certification Available at SSPC 2014

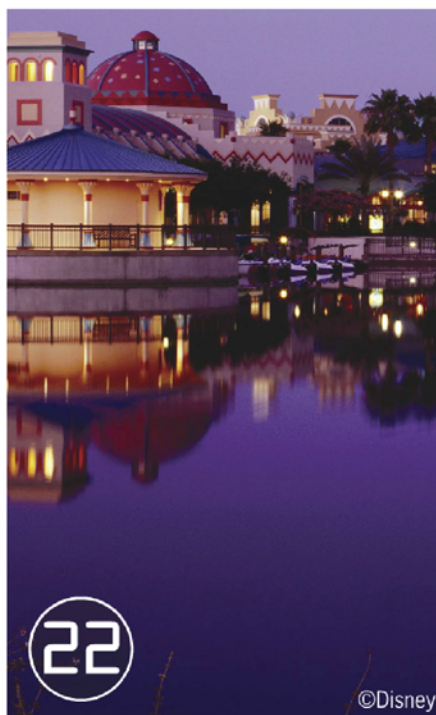

SSPC 2014 featuring GreenCOAT will be held Feb. 10–13 in Lake Buena Vista, FL. A full lineup of workshops, training, and certification courses is scheduled for the conference. This article offers a preview of these workshops and courses, along with the dates and times they will be held. All information is current as of press time.

37 2013 Annual Coating Systems Buying Guide

By the JPCL Staff

The 2013 JPCL Coating Systems Buying Guide lists more than 4,400 recommendations for protective and marine coating and lining systems provided by more than 300 coating manufacturers. Suitable high-performance coating and lining systems for steel and concrete on bridges, power plants, transmission pipelines, marine structures, and other types of industries, structures, and vessels are detailed, as well as systems for several specialty functions. Listings are alphabetized by company name, and, in addition to the generic type, recommended coating systems include a manufacturer's brand name or product number.

The Guide is intended as a resource for facility owners, third-party specifiers, contractors, or others involved in protective and marine coatings projects. The Table of Contents for the Guide is on p. 39; listings begin on p. 41; and company profiles begin on p. 151.

A Salute to the Government Employee

I am writing this editorial two days after the tragic shooting at the Naval Sea Systems Command Headquarters (NAVSEA) in Washington, D.C. Twelve innocent people lost their lives that day. They were husbands and wives, fathers and mothers, sons and daughters. Each is someone's loved one, and each is gone forever. This editorial is not going to dwell on violence in our society, gun control, or the many other factors that come into focus when such tragedies occur. I just want to say that I am certain that all of these victims were good, honest, hard-working people either in the federal workforce or with a contractor assisting some branch of the U.S. Navy in accomplishing their global mission, and never expected to have their lives taken that day.

I think the Government workforce generally gets criticized unfairly because of the one or two less-than-stellar employees that every organization has. For two years, I was responsible for a small Army post in Virginia that employed 150 to 300 Department of the Army civilians, depending on the season. I cannot remember one employee not putting in a full, productive day for the government. They all cared and worked diligently supporting the soldiers, sailors, and Marines that used the base for training. Those service members were their customers, and the civilians knew it. They knew their jobs were to support the "war fighter" or the "tip of the spear."

Up to that point in my career, I had very little interaction with many civilian government employees. I had always been with the soldiers, or the "green suiters," as we were called. Shortly after I took command of that small post, a terrible thunderstorm around midnight knocked out all the power. Driving to the post headquarters after the thunder and lightning subsided, I noticed a couple of bucket trucks off to the side of the road with the arms extended at a transformer that had been damaged by the storm. The Post Engineer's electricians were already on the job restoring power. Nobody called them; they just came to the post because they had

the feeling that power might be lost, and their job was to make sure that we had power to some critical buildings on post. This started my true education and the shift of a false paradigm I had on the Federal civilian workforce. This is only one of many stories of the superb dedication of those folks during my tenure.

Right now, SSPC does training for Department of Defense personnel. I have attended many meetings with government employees from the DoD Office of Corrosion Policy and Oversight and the contract workers who support them. SSPC's training courses are also specified by many government agencies (NAVSEA, for one) and I have come to know those folks who are responsible for that quite well. All those agencies have employees who are dedicated, conscientious, and caring individuals who want to be good stewards of taxpayer dollars and do what is best for their organization and for the nation. We have a State employee on the SSPC Board, and he is totally dedicated to his State and is actively involved in SSPC because his focus is to make the coatings industry better and thus make his Transportation Cabinet more efficient and cost effective.

So the next time you have interaction with a government employee that you feel does not care or is not putting his or her best effort forward, think again. Remember the 99.9% out there who are putting their best foot forward and doing the best they can for whatever government agency they serve.

My thoughts and prayers go out to all the victims of these types of senseless crimes, whether it is the Colorado movie theater shootings, Newtown, or NAVSEA.

Free Power Tools Webinar Available

November's new, free edition of the SSPC/JPCL Webinar Education Series, "Steps to a More Effective Power Tool Cleaning," will be presented on Wednesday, November 6,

Earl Bowry

from 11:00 a.m. to 12:00 noon, EST. This webinar will explain power tool cleaning and how to effectively remove loose rust, mill scale, and paint. The presentation will describe two types of power tools, electrical and pneumatic equipment. It will discuss reducing air pollution by using high efficiency particulate air (HEPA) vacuum lines. Description of how power tools are used frequently for spot cleaning of damaged coatings, where contamination of adjacent areas by abrasive is unacceptable, and when a surface-tolerant coating such as oil-based paint is to be used,

will also be presented.

Earl Bowry, Industrial Engineer and Protective Coatings Specialist at Newport News Shipbuilding in Newport News, VA, will present this webinar. Bowry has been involved in the industrial and marine coating industry for over 40 years, inspecting ships, consulting with shipyards, and instructing coating inspection and application courses worldwide. He has held sales, marketing, and technical engineering posi-

tions for Ameron, Carboline, Virginia Materials, and Jotun Paints, and is an SSPC and NACE Protective Coatings Specialist. He has authored and presented papers at Mega Rust, NACE, and SSPC conferences, as well as authoring or co-authoring training programs for NACE, including the CIP 1 & 2, the Navy's SCAT course, and the NACE CIP 2 Marine Course. He has also been the author or co-author of SSPC's C12 Airless Spray Certification, C7 Abrasive

Blaster Certification, C14 Marine Plural Component Spray Certification, and the Marine Coatings Course.

Registration, CEU Credits

The SSPC/JPCL Webinar Education Series provides continuing education for SSPC re-certifications and technology updates on important topics.

SSPC is an accredited training provider for the Florida Board of Professional Engineers (FBPE).

OSHA Publishes New Crystalline Silica Rule

The Occupational Safety and Health Administration (OSHA) has published its Proposed Rule on Occupational Exposure to Respirable Crystalline Silica, first announced Aug. 23, in the September 12, 2013 *Federal Register*.

The proposed rulemaking includes two separate standards—one for general industry and maritime employment, and one for construction. The proposals include a new uniform exposure limit for crystalline silica and detailed methods for controlling worker exposure, conducting medical surveillance, training workers about silica-related hazards, and recordkeeping measures.

According to OSHA, the regulation will affect about 470,000 small businesses or government offices at an annual cost of \$637 million. OSHA predicts that 1.3 million workers at small businesses are exposed to silica dust, and that this new regulation will save 688 lives and prevent 1,600 cases of the lung disease silicosis each year.

Additional information on the proposed rule, including five fact sheets as well as procedures for submitting written comments and participating in public hearings, is available at <http://www.osha.gov/silica/index.html>. The proposal was also discussed in Alison B. Kaelin's September 2013 JPCL article, "OSHA's Proposed Rule for Silica Exposure Hits the Streets," pp. 52-53.

SSPC is also currently seeking comments by December 11, 2013, from industry professionals regarding the new rule. For more information on submitting comments, please see this month's SSPC News section (p. 33).

Professional Engineers in Florida may submit SSPC Webinar Continuing Education Units to the board. To do so, applicants must download the FBPE CEU form and pass the Webinar Exam, which costs \$25.

Register for this online presentation at paintsquare.com/webinars.

Sherwin-Williams Acquires Comex's North American Business

Sherwin-Williams has completed acquisition of the North American paint business of Consorcio Comex, S.A. de C.V., the companies announced. However, Sherwin-Williams's plan to acquire Comex's Latin American assets remains on hold as of press time.

Sherwin-Williams will pay \$90 million in cash and assume about \$75 million in liabilities for Comex's 314 stores and eight manufacturing sites in the United States and Canada, the company said on Sept. 16.

The Mexico City-based Comex boasts the world's largest exclusive paint retail network and is the leading architectural paint and coating producer in Mexico and Central America, with 3,300 points of sale operated by 750 concessionaires.

Comex also produces industrial, protective, and marine coatings.

The North American deal includes 314 Comex stores (234 in the U.S. and 80 in Canada) as well as eight manufacturing sites. Comex also supplies paint and coating products to about 1,500 external retailers in Canada. Sherwin-Williams owns 3,542 paint stores, and its Paint Stores Group performance helped drive record sales for the company in the second quarter. The Comex NA acquisition will give Sherwin-Williams 3,856 stores.

Last November, Sherwin-Williams announced its plans to buy the Comex Group for \$2.34 billion, to extend the Cleveland firm's footprint in the Americas. In July, however, Sherwin-Williams announced that The Federal Competition Commission of Mexico had rejected the deal in a 3-2 vote.

Hempel Recognized for Market Growth

Coatings supplier Hempel was recently awarded the 2013 North American Protective and Marine Coatings Growth Excellence Leadership Award by Frost & Sullivan, a global research organization that provides

growth consulting; technology, market, and economic research; corporate best practices training; customer research; and more. This honor is presented to a company that has demonstrated excellence in capturing the highest compound annual growth rate for the past three years.

The award is part of Frost & Sullivan's Best Practices Awards, which recognize companies in a variety of regional and global markets for "demonstrating outstanding achievement and superior performance" in leadership, technological innovation, customer service, strategic product development, and other areas.

Hempel had double-digit revenue growth exceeding 20 percent in 2012 and a 9.5 percent increased market share in North America. According to Frost & Sullivan, competitors saw revenue growth rates that were more closely aligned with the base year total market growth rate of 2.1 percent. By acquiring Blome International in 2012,

Hempel complemented its existing product lines, particularly in the oil and gas industry, and became more aggressive in growing its market share, Frost & Sullivan noted.

The award announcement cited the "unique characteristics" of Hempel's total technology offering, including silicones in marine coatings and polysiloxane in protective coatings, plus services such as an onboard software reporting tool for marine applications that provides operational data and improves fuel savings and overall efficiency.

In addition, Hempel has strengthened its existing product lines, instead of expanding into other coating segments that are not the company's main focus, according to Frost & Sullivan. One of the company's main goals is to double its global protective business, with an emphasis on North America.

Hempel was also acknowledged for its field-service representatives, who develop customized solutions for customers, allowing end users to observe the newest technologies in the industry's harsh environments.

Problem Solving Forum

Testing Adhesion of Multi-Coat Systems

**When should the adhesion of an applied
coating or lining multi-coat system be tested?**

**From Karen Fischer
Amstar of WNY**

Adhesion testing should be performed for one of two basic reasons:

- if the specification calls for it as a qualifying test for acceptance of the coating system, or
- if there is a failure or suspected failure in the coating system (material and/or methods) that cannot be evaluated (or fully evaluated) by non-destructive methods.

One must always keep in mind that an adhesion test is a destructive test, so the resulting test area now becomes a repair that could, in itself, fail. This is especially important to keep in mind in the case of linings or any system that will be in immersion service, mechanical service, or a chemical/harsh environmental service. Because it may be necessary to perform adhesion testing in multiple areas (depending on the size of the suspected areas), there will be multiple repairs. Destructive testing should always be the last method employed, not the first method, when evaluating a coating for suspected or obvious failure.

**From James Albertoni
CA Department of Water Resources**

Some good instances where a multi-coat system should be tested for adhesion

include if the re-coat window is missed, if the topcoat is not specifically recommended by the manufacturer to be compatible with the basecoat, if the basecoat and topcoat are from two different manufacturers, or if it is suspected one of the coats was mixed slightly off ratio. Most importantly, the system should always be tested for adhesion if the spec calls for it.

**From Daniel Liu
APC**

First, it will be up to the specifier to decide if an adhesion test is required, and, if so, the specification should include not just the testing requirement but also the acceptance criteria and tester type. From my experience in the field of tank coating, this test is normally not required in the specification because it is a destructive method. Any repair area creates a weak point in the lining, so the more repair areas you have, the more weak spots you have.

However, it is quite necessary to make a proper adhesion test recommended by the paint maker when application has or may have deviated from the specification, such as by exceeding the recoat interval, not maintaining the proper level of humidity, or using the wrong mixing ratio for plural-component coatings. Adhesion is quite important

for tank coatings that are to be immersed in liquid. But passing the adhesion test does not mean the whole coating system is conclusively qualified for service. The test is only a reference.

From Tom Swan

M-TEST

It's important to note that if an adhesion test is called for in the specification, the document should specify failure criteria as well as the pull tester to be. All pull testers pull at different rates, and, when I discuss pull tests with most people, they have no idea what the pass/fail criterion is or what adhesion tester to use.

If you want to use adhesion testing for pass/fail testing, the specifications should specify the minimum pull required and what test instrument to use. Also note that if you stop the test before the coating fails, there is no guarantee that the pull fixture will not take off the coating when you try to remove the fixture, nor does passing the test guarantee that the adhesion or coating integrity was not affected by the pull.

From Manpreet Singh

Spiecapag Australia PTY LTD

If the client's specification calls for adhesion testing, the paint system should be simulated on a test specimen of the same material class, 100 mm² and 6 mm thick. ISO 4624 describes the method of performing the adhesion test. Acceptance criteria, unless specified by the end user, shall be a minimum of 7 MPA at 23 C, and, at 65 C, no more than 40% decrease from pull-off at 23 C.

From Atanas Cholakov

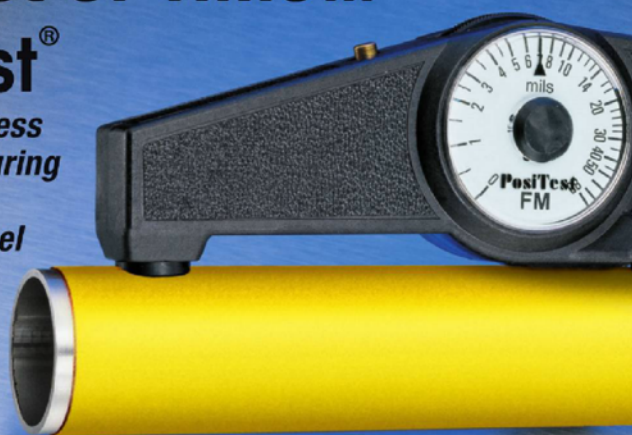

ACT

Adhesion should be tested after the complete cure of the coating system. Information on curing can be acquired from the paint supplier's technical representative. In the product data sheet, curing is highlight-

ed in a table in accordance with different ambient temperatures and other conditions.

From Trevor Neale

TF Warren Group

Critical service specifications typically call for adhesion testing, so I assume this question relates to field painting where weather and

other delays are often unavoidable and formal adhesion testing is not part of the job/project specification. If there is any suspicion that adhesion may be compromised, then the appropriate form of adhesion testing is recommended to ensure the complete system integrity. This is simply a CYA procedure to avoid possible conflicts, or worse, premature failures.

From Bryant Chandler

Greenman-Pedersen, Inc.

Adhesion testing on coatings must be done after the proper cure time at the correct temperature. This enables the coating to develop the full physical properties. If the coating is tested prematurely, the results often will not meet the specified minimum requirement. The test may or may not be destructive, depending on the thickness of the coating/substrate, and whether or not the test is continued until coating disbondment.

As called for in ASTM D 7234 (adhesion testing of coatings on concrete), scoring around the dolly down to the substrate will require a repair even if the test does not go to failure and stops at the minimum test value; a thick coating system (>30–40 mils) on a metallic substrate may require scoring if called for in the specification. If the test can be stopped at the minimum value specified without causing coating failure, then the dolly can be removed, often times by striking the dolly with a sharp blow from the side or carefully inserting a sharp 5:1 tool (putty knife) at the glue line and shearing off the dolly. Repairing the top surface may be required but is much better than having to repair the total coating system.

When testing thermal spray coatings, always perform the adhesion tests before application of the seal coat. Tests performed after seal coat application will result in test values that are two to three times the value of virgin thermal sprayed coating.

Q&A WITH ERNEST DUNBAR

BY CHARLES LANGE, JPCL

Ernest Dunbar is the Midwest General Manager for Manta Industrial, a K2 Industrial Services Company, based out of

Hammond, IN, that provides corrosion protection and high-performance coatings and linings services for highly corrosive industrial environments. Dunbar is responsible for managing several of the company's larger customer accounts, as well as reviewing and supervising projects for two of the company's project managers. He is an SSPC-certified Quality Control Supervisor and a NACE Level 1-certified Coating Inspector. He is also the Secretary of SSPC's recently relaunched Midwest Chapter.

JPCL: How did you get your start in the coatings industry?

ED: I actually started in the Purchasing Department and initially worked for Tony Bochniak, who is now the President of Manta Industrial and Cannon Sline, both K2 Industrial Companies. One of the former owners of J.L. Manta, Leo Manta, was a friend from the Assumption Greek Orthodox Church in

Olympia Fields, IL, and he offered me the position. I eventually became in charge of Purchasing and Shop Operations for J.L. Manta, worked for a short period in the project development side, and then got into estimating and managing projects. I've seen several aspects of the business over my 31-year career.

JPCL: You were also a sports writer for many years. How did you get involved in that field? What did you enjoy about sports writing? Are there any skills that you developed as a sports writer that you still use at your current job?

ED: My first job after graduating from the University of Michigan in 1979 was with a community newspaper based out of Chicago Heights, IL. I was a full-time employee there for three years, and then decided, for financial reasons, to move into a different career. Sports writing was my passion and what I really wanted to do, but I didn't see having a mortgage, car payments, and raising a family on the newspaper salaries available at the time.

The skills I developed from sports writing that I still use in industrial painting are being able to meet deadlines and being able to communicate effectively. Whether it is writing a

scope letter or speaking to employees, being clear in your communication skills is important to your success.

JPCL: You spent some time working for both Manta and the newspaper. Was it difficult working two jobs at once? How did you manage to stay on top of your work at both jobs—especially two jobs with such different subject matter?

ED: My priority was always my full-time job, which was industrial painting. The sports writing was all high school sports, either at night or on weekends, so it didn't present many conflicts. Sports writing was a part-time job for me, and I had a great editor during my 29 years there who understood if I had out-of-town trips or other conflicts which prevented me from taking a newspaper assignment. The sports writing became more of a hobby, and it was something fun to do. It came pretty naturally, so it wasn't really stressful.

JPCL: SSPC's Midwest Chapter was recently relaunched. As a Board member for the chapter, what can you say about the benefits of having an active SSPC chapter again in your area?

ED: We're starting to see an interest in the group as an organization that can address issues contractors in the area may have with policies and regulations that impact our companies. We've had some great ideas from the membership and just need our committees active now so that contractors who actively participate in the chapter see some real value in offering their opinions and donating their time to make this a success.

JPCL: The Midwest Chapter recently held its first golf outing, which drew over 100 attendees. What can you say about the overall success of the event, and what importance do you place in social industry events such as this?

ED: I thought it was great to see a collection of contractors, material suppliers, and equipment vendors together enjoying the event. One goal in holding the outing was to assist the chapter in developing a solid financial base to work from. With the strong support we received from everyone in our inaugural event, we were able to accomplish that. Our Board feels that there needs to be a balance between social meetings that bring the membership together, and the business meetings.

JPCL: What is your favorite thing about the work that you do now?

ED: Definitely the variety of challenges we face on a continual basis to work safely and provide a quality service to our customers. It's rewarding to see the hard work pay off in a successful project.

JPCL: What has been the highlight or proudest moment of your career thus far?

ED: The longevity I've had with a single organization is something I am extremely proud of. I've had other opportunities to work for other companies, but the K2 organization has been loyal to me and treated me fairly over the years. I am loyal to them because of that.

JPCL: What are some of your interests outside of work? How do you like to spend your free time?

ED: I enjoy teaching my 7th grade Sunday School class at St. George Greek Orthodox Church in Schererville, IN. I've done that for the past 18 years. I also spend my free time watching college and professional sports, mostly on television.

Applicator Training Bulletin

Photo: JPCL

Editor's Note: This Applicator Training Bulletin is based on the original May 1989 Applicator Training Bulletin by David Hollkamp, which was updated by the Houston Coating Society in February 2005 and revised slightly for the present issue.

Basic Training in Brush and Roller Application

Due to a variety of factors, many facility owners require contractors to perform some applications by brush and roller, such as when tanks or structures to be painted cannot be taken out of service or are near a well-traveled road, parking lot, or residential area. Such situations have created a need for some basic training in brush and roller application.

As a craftsperson, you may have started out as a helper, carrying bags of abrasive and tending the spray equipment. The next step was likely to become a blaster or

spray applicator, with little time spent with a brush or roller. Even if you have some experience with brushing and rolling as a residential or commercial painter, most high-performance industrial coatings are intended for spray application. If applied by brush or roller, they don't handle the same as paints used residentially. Even though industrial coating manufacturers are responding to the needs of their customers and are developing formulas of some products with brush and roller application in mind, the coatings can become tacky more quickly and more resistant to flow out.

Applicator Training Bulletin

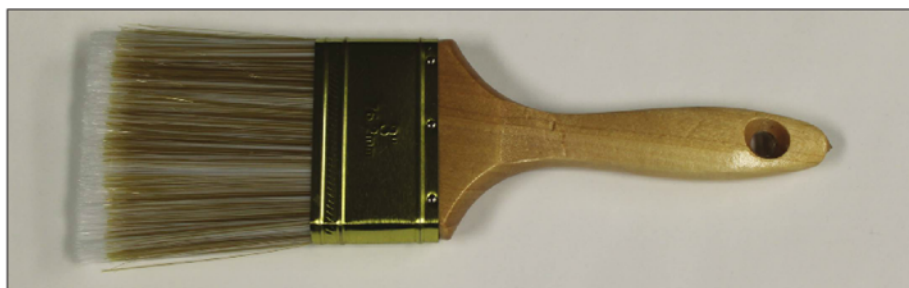

Fig. 1: 3 1/2-inch squared end or flat brush
Photo: JPCL

The entire approach to the job may also have to change when using brushes and rollers instead of spray application equipment. For example, coatings designed to be sprayed at a dry film thickness (DFT) of 5 mils may build to only 2 to 3 mils' DFT by roller application, necessitating the application of two coats rather than one. If it's determined that the entire coating project must be done with brush and roller, it may be necessary to change the coating system.

Contractors and owners should consult with the coating manufacturer to obtain recommendations in these instances to achieve quality results with brush or roller application.

Selecting the Proper Tool

The choice between a brush and a roller depends on what is to be coated. Large, flat areas such as tanks, buildings, interior walls, ceilings, and floors are best coated by roller application. Tighter areas, such as pipe racks, intricate structural steel designs, and piping in process units, stairways, handrails, and doors may require brush application.

Brush Application

The first step in creating a quality job is to choose a brush suitable for the job. Factors such as the type of paint or coating to be used, the size and shape of the object to be coated, and the look of the finish demanded by the owner guide this selection process. The brush has to remain workable in the solvents used in the coating to be applied. Typically, the largest brush suitable for the size and shape of the object should be used to increase pro-

ductivity. Generally, squared end brushes called wall brushes are used on flat areas (Fig. 1). Angular cut "sash" brushes, which are 2 to 3 in. wide, are used on narrow surfaces (Fig. 2). Oval brushes with diameters up to 2 in. are used on irregular surfaces such as nuts and bolts. When owners are quite particular about the look of the finish coat, a higher quality brush may be in order.

Brushes are available with either natural bristles or synthetic bristles such as nylon or polyester. As a general rule, use natural bristle brushes for solvent-borne coatings and synthetic bristles for waterborne coatings. Solvents will soften synthetic bristles, causing them to swell and lose their stiffness. The same is true of natural bristle brushes used with waterborne coatings. It is always best to consult with the coatings manufacturer to determine acceptable types of bristles for the coating being applied.

It is important to use high-quality brushes and to keep them in good condition. Brushes should have bristles that are "flagged" or split on the end. These hold more coating material and improve productivity. Brushes that cost less initially may lead to a more costly job overall when factors such as brush life, productivity, and rework due to poor quality are included in the equation.

Before coating application, remove all loose bristles or filaments by working the brush back and forth across your hand. You can also hit the brush on a solid surface to remove any dust or loose bristles. After dipping the brush into the coating, tap it lightly on the inside of the container to remove any

excess coating. The idea is to load the brush with enough coating to get some work done, but not so much that the coating drips and splatters while in use.

Apply the coating in smooth, even strokes using the tip edge of the brush. Hold the brush like a pencil, and brush in smooth, steady strokes. Bearing down too hard on the brush causes excessive wear to the tool and often results in a less than satisfactory finish.

Always paint from top to bottom. For best blending, work from unpainted areas into painted areas, and don't stop painting until you reach a natural breaking point such as a corner, door, or window. When there is an accumulation of coating at or near the top of the brush, work the coating out of the brush on an unpainted area of the work piece. Always keep the work piece "squared off." Finish all strokes in the same direction into the painted area to prevent brush marks. Use sufficient coating material to achieve a uniform finish. Don't spread the

Free Webinar on Steps to a More Effective Power Tool Cleaning

This webinar will explain power tool cleaning and how to effectively remove corrosion, mill scale, and coatings. This presentation will describe a variety of power tools, both electrical and pneumatic. It will discuss that by use of high efficiency particulate air (HEPA) vacuum lines a reduction in air pollution is accomplished in the cleaning operation.

Photo: JPCL*

paint too thickly, or you might have drips, sagging, poor curing, or other problems.

Unless your crew is using throwaway brushes, care should be taken to prevent brushes from drying with coating in them. You should be aware of the pot life if using a multiple-component coating. Pot lives range from less than an hour to more than 8 hours, depending upon the generic type of the coating material being applied. Always consult the manufacturer's application data sheets for exact information. Even before the brush stiffens completely, there will be a gradual loss of flexibility. Periodic cleaning of the brushes will extend their life as well as increase your productivity. Remember to follow the manufacturer's recommendations to clean the brushes correctly for the type of coating being applied.

Roller Application

As in brush application, the first step towards a quality job is to choose a roller

cover suitable for the job (Fig. 3). The same factors mentioned for brushes affect the choice of roller cover. Flat finish paints are best applied with a polyester fabric. Enamels and gloss paints use a woven or lambskin fabric. Again, it is best to consult the coatings manufacturer for recommendations. The core of the roller cover must be able to keep its round shape and not absorb water or solvent. The thickness of the nap will vary from 1/8 in. up to 1 1/2 in. for use on very smooth to very rough or uneven surfaces. Thicker naps on rougher surfaces make it possible to deposit coating material into deep recesses.

Before using the roller, rub the dry roller cover briskly to raise the nap. Fill the coating container tray about half full. Load the roller uniformly by rolling it into the coating, then back and forth on the tray ramp.

Before you use a new roller, roll it out completely on newspapers. This conditions the fibers and works out air bubbles. For large

jobs, a half-filled, five-gallon bucket with a bucket spreader screen can be used. You can precondition the roller on the spreader screen instead of newspaper.

The first step in application is to "cut in" by applying a three-inch strip at corners, window frames, and other protrusions from the flat surface. This is typically accomplished using a three- or four-inch brush. Cut in as you go to make sure that the stripe coat is still wet when you are coating the adjacent areas. This allows the rolled area to blend in with the "cut in" area.

For high-performance coatings, the fastest method of application is the "W" method. Roll the paint on by making a large "W" about three feet wide, using only enough pressure to transfer the coating material to the surface. Then roll back and forth to evenly spread toward the finished surface to pick up any excess coating material. On vertical surfaces, the first stroke after each loading of the roller must be upward. Otherwise, the

paint pressed out of the roller on the first revolution will run down the surface. Also, always finish off in one direction for a uniform appearance. As in brush application, don't stop painting until you reach a natural break such as a corner, door, or weld seam.

On rough surfaces such as pitted steel, put a little pressure on the roller so that it pushes a small bead of coating material ahead of it to fill the depressions in the surface. Exert this pressure only on the upward stroke and release pressure on the down stroke to avoid dripping. It may be necessary to give a light re-roll after a few minutes to pick up excess coating that may run out of the pits.

Remember, you want to use a longer nap on pitted or rough surfaces. A minimum of $\frac{3}{4}$ in. is recommended. While this will help work the coating material into the surface, it will not give as smooth a finish as shorter nap rollers. Shorter nap rollers should be used where appearance is important, especially when applying the topcoat.

As with brushes, care should be taken to protect roller covers from drying with coating material in them. The same concerns about the pot life affect roller covers. Scrape excess coating off the roller cover back into the coating container. Remove the cover from the frame and rinse it in the cleaner specified by the manufacturer for the coating being applied. Repeat as necessary until free of coating material. To avoid damage to the roller, do not soak the sleeve in solvent or water.

Conclusion

Just as with spray applications, brush and roller applications require care in the selection of the appropriate tool for a given job, in the application of sufficient coating material to assure film build and coverage, in the manner and direction of strokes used to apply the coatings, and in the care and cleaning of the tools.

TRAINING AND CERTIFICATION

SSPC 2014 featuring **GREENCOAT**

SSPC 2014 featuring GreenCOAT, held Feb. 10–13, 2014, at the Coronado Springs Resort in Lake Buena Vista, FL, will offer several training and certification opportunities for its attendees.

The following is a preview of scheduled workshops and training and certification courses. Some programs extend before or after the scheduled conference dates. All information is current as of press time. For updates, please visit sspc2014.com.

WORKSHOPS

There are nine workshops scheduled as part of SSPC 2014's technical program. Questions about the technical program can be directed to Sara Badami at badami@sspc.org; or 412-281-2331, ext. 2208.

■ MONDAY, FEBRUARY 10

Afternoon Session 1, 1:30–4:30 p.m.

"Proper Use of Coatings Inspection Instruments and Visual Guides,"

by Matt Fajt and Richard Burgess, PCS, KTA-Tator, Inc.

This workshop will discuss the proper use of coatings inspection instruments, as well as the industry standards vital for those involved in corrosion protection using protective coating and lining systems. It includes an orientation to the basics of instrument use, followed by a series of hands-on workshops. Small groups will work with gages and visual guides on a number of topics, including measuring ambient conditions and surface temperature; measuring surface profile; assessing surface cleanliness (SSPC Visual Guides); measuring coating thickness by destructive means; detecting surface chlorides/conductivity; and measuring coating thickness.

Afternoon Session 3, 1:30–4:30 p.m.

"An In-Depth Look at Standards Most Frequently Used by Industrial Painters," **by L. Skip Vernon, PCS, MCI, Coating and Lining Technologies, Inc.; and** **Michael Damiano, PCS, SSPC: The Society for Protective Coatings**

This workshop will explore new and recently revised versions of SSPC standards used by industrial painters, including a review of the revised water jetting standards; revisions to SSPC-PA 2, SSPC-SP 11, SSPC-SP 15 and SSPC-AB 1; the new SSPC standard for determining compliance with steel profile requirements, and some of the most frequently encountered existing SSPC standards. The workshop will address what constitutes an industry standard, the contractual implications of specifying using only a standard, and the impact of secondary and tertiary references in standards.

■ TUESDAY, FEBRUARY 11

Afternoon Session 1, 1:30–4:30 p.m.

"Failure Analysis of Paints and Coatings," **by Dwight G. Weldon, PCS, Weldon Laboratories, Inc.; and** **Gary L. Tinklenberg, PCS, Tinklenberg Consulting Group**

With almost 70 years of combined failure analysis experience, the two instructors for this workshop will present the methodology involved in solving coating failures. Topics will include what to look for at the jobsite, sample taking, laboratory techniques, and what you can learn from laboratory testing. Emphasis will be placed on recognizing patterns in the failure, and the significance of those patterns. Several laboratory techniques will be covered, such as microscopy, infrared spectroscopy,

SEM-EDS, gas chromatography, and differential scanning calorimetry. The limitations of these techniques will also be discussed. Case histories will be presented covering several types of coatings and failures.

Afternoon Session 3, 1:30–4:30 p.m.

"Confined Space Safety Training," **by Charles Brown,** **Greenman-Pedersen, Inc.**

This workshop will review what owners, contractors, and safety personnel need to know in order to comply with the OSHA 1910.146 Permit Required Confined Space regulations. The instructor will discuss definitions of confined spaces, testing, permits, written programs, workplace surveys, and training requirements. The workshop will review the difference between permit required and non-permit required confined spaces; confined space hazards; PPE and equipment requirements; and the duties of authorized entrants, attendants, and entry supervisors. There will also be a discussion on the types of safety equipment for confined spaces.

■ WEDNESDAY, FEBRUARY 12

Afternoon Session 1, 3:00–5:00 p.m.

"Coating Inspector Forum," **by Earl Bowry, PCS, Jotun Paints, Inc.;** **and J. Peter Ault, Elzly Technology Corporation**

This workshop will address a number of topics, including:

- Should continuing education be required for coating inspectors?
- Inspection ethics and etiquette; when does the inspector become a liability rather than an asset?

AVAILABLE AT SSPC 2014

©Disney

-Should an inspector be a teacher/mentor as well as an inspector?
-Should an inspector help a contractor; where is the line drawn when the inspector tries to assist the applicator?

Afternoon Session 4, 3:00–5:00 p.m.

**“Waterborne Protective Coatings”
(GreenCOAT), by Dr. Leo J. Procopio,
The Dow Chemical Company**

This workshop will provide an overview of waterborne coatings, with a detailed discussion on waterborne acrylic, epoxy, and polyurethane technologies. It will focus on polymer chemistry and how waterborne resins are produced (e.g., what is unique about an acrylic latex or epoxy dispersion versus a solvent borne analog); formulation of waterborne resins into coatings; the mechanism of film formation; performance

expectations; and recent developments in improving performance. Suitable environments and end-use applications for waterborne coatings will also be discussed, along with common causes of and solutions for coating defects and failures. Surface preparation, application methods and conditions, and equipment considerations unique to waterborne technologies will also be described.

THURSDAY, FEBRUARY 13

Mid-Morning Session 1,

10:00 a.m.–12:00 noon

“Painting Over Hot Galvanizing with Live Adhesion Testing,” by Kevin Irving, AZZ Galvanizing Services; Dee McNeill, The Sherwin-Williams Company; Ted Hopwood, PCS, Kentucky Transportation Center, University of

Kentucky; and Todd Williams, Ph.D. and Ahren Olson, Bayer MaterialScience LLC

This workshop will explain the “synergistic effect” between painting and galvanizing to protect steel surfaces from corrosion. It will discuss the benefits of painting over galvanizing, including extended service life and cost-saving. The workshop will explain the science of HDG steel and will provide a review of ASTM D6386, Standard Practice for the Preparation of Zinc (Hot-Dip Galvanized) Coated Iron and Steel Product and Hardware Surfaces for Painting. Attendees will use HDG steel samples that will be painted by the Bayer Lab and the University of Kentucky to perform adhesion testing of the paint. There will also be a highlight of a 100-year maintenance-free bridge that FHWA is currently seeking.

**Mid-Morning Session 4,
10:00 a.m.–12:00 noon**

**“Protective Coatings—An Overview,”
by Christopher Farschon, PCS,
Tony Serdenes, Kirk Shields, and Ron
Queensbury, Greenman-Pedersen, Inc.**

The workshop will provide an overview of an industrial protective coatings project, including design considerations, material selection, surface preparation guides, ambient conditions, and basic quality control techniques. It will provide a basic understanding of how protective coatings are specified and applied to meet the goals of a project, and will review typical inspection instruments used on a paint project, surface preparation guides, how to read a product data sheet, and how to measure ambient conditions. The workshop will include participation exercises and examples of some industrial coatings materials.

Afternoon Session 2, 3:00–5:00 p.m.

**“Writing Effective Corrective Actions,”
by Cory Allen, PCS, Vulcan Painters,
Inc.**

This hands-on, interactive session will train participants to write effective corrective actions as they relate to typical problems for an industrial coating contractor. This workshop should be particularly attractive to SSPC-QP-certified contractors, as QP 1-certified contractors are required to document corrective actions. It will include a review of quality standards that require corrective actions (e.g., -QP 1, ISO 9001, NQA-1, etc.); the corrective action process and format; the background and benefits of corrective actions; and how to determine the effectiveness of a corrective action. Key definitions and case histories will be presented as each component is examined.

**TRAINING AND
CERTIFICATION PROGRAMS**

Registration for all SSPC Training Courses must be done separately from the SSPC 2014 conference registration. Some courses have prerequisites, which can be found under the “Training and Certification” section of the show website, sspc2014.com. To register, e-mail or fax a completed training registration form to Nicole Lourette at lourette@sspc.org, or 412-281-9993. Information on how to complete registration is also available at sspc.org/how_to_register/. The deadline to register is January 17, 2014.

**Navigating NAVSEA Standard
Item 009-32
Feb. 7**

This course describes the naval ship cleaning and painting requirements found in Standard Item 009-32. It covers the cleanliness, surface preparation, coating application requirements,

THE MBX® BRISTLE BLASTER

and system application instructions for various Navy vessels. Requirements of referenced standards are also reviewed. This course will help attendees better understand the painting requirements outlined for U.S. Navy surface ships, submarines, and aircraft carriers.

Applicator Train-the-Trainer (ATT) Feb. 13-14

This course is designed to train owners, supervisors, and other representatives of industrial painting contracting companies on the delivery of two levels of the SSPC Applicator Training Program for surface preparation and coating application. It provides a standardized curriculum for applicator training to present at the shop or job site.

Bridge Coating Inspector (BCI) Feb. 8-12 (Level 1); Feb. 8-13 (Level 2)

The BCI program covers the fundamentals of how to inspect surface preparation and application of protective coatings on bridge steel. The course covers situations that affect inspection in the field (e.g. containment, field safety hazards, changing weather conditions), and the skills required to inspect new bridge steel painted in the shop, in the field, or maintenance systems applied in the field.

Fundamentals of Protective Coatings (C1) Feb. 8-12

C1 provides an overview for those who are new to the protective coatings industry. It is also an ideal refresher for reviewing the fundamentals of corrosion and the use of coatings as a protective mechanism against corrosion and deterioration of industrial structures.

Planning & Specifying Industrial Painting Projects (C2) Feb. 8-12

C2 is designed to provide those who understand coating fundamentals with an overview of the principles of planning, awarding, and monitoring the quality of new construction or maintenance painting projects. Students will become familiar with tools to develop effective

coating projects and play a more active role in managing painting projects to successful completion.

Lead Paint Removal (C3) Feb. 10-13

The C3 course includes background information on the hazards of lead and other toxic

metals, as well as the current legal and regulatory environment. The course contains specific discussions on protecting workers, compliance with environmental regulations, proper management of waste streams and operations that result in potential exposures to lead, and associated control technology. The course also addresses reading specifications

New

PosiTector® DPM Dew Point Meter

Advanced model shown with built-in probe

Measures and records environmental conditions

- Available with either a Built-in or Magnetic Separate probe and 2 models to choose from—Standard or Advanced
- All models include memory, statistics, USB port
- Auto Log mode—ideal for unattended operation
- Browse gage readings and charts using your computer's file explorer or upload to PosiTector.net
- **NEW** PosiTector body accepts all PosiTector DPM, SPG and 6000 probes easily converting from a dew point meter to a surface profile gage or coating thickness gage

and developing programs to effectively control risks to workers, the public, and the environment. There will be a discussion of insurance and bonding issues and an introduction to other safety and health issues.

Lead Paint Removal Refresher (C5) Feb. 12

C5 provides refresher training for supervisors/competent persons responsible for industrial deleading operations. It includes a review of basic information about lead and its human health hazards; a review and update of relevant EPA regulations and progresses through discussions of 29 CFR 1926.62 and changes in the Respiratory Protection Standard (29 CFR 1910.134); and discussions about emissions control as presented in SSPC Guide 6.

Several state supplements are available. The C5 course also meets the requirements of state programs that require refresher training

to maintain supervisor certification and meets QP 2 requirements for competent person refresher training certification.

Abrasive Blasting Program (C7) Feb. 11-12

C7 is designed for contractor personnel who wish to obtain certification or others who wish to learn about dry abrasive blast cleaning of steel. It covers principles of surface preparation, surface cleanliness, surface profile, dust and debris control, and abrasives. Students who do not want to receive the C7 certification can attend and receive a certificate of attendance by only attending the lecture portion of the training and observing the blaster demonstration.

Floor Coating Basics (C10) Feb. 8-9

This course is designed to meet the practical training requirements of SSPC-QP 8 Section 4.4, which require that each job crew chief and each QC manager complete a minimum two-day overview of concrete components, coating and surfacing types, and surface preparation and substrate repair techniques based on SSPC consensus standards TU-10, "Procedures for Applying Thick Film Coatings and Surfacing Over Concrete Floors."

Airless Spray Basics (C12) Feb. 9-10

C12 is designed to train and certify marine/industrial applicators to operate airless spray equipment. The course also assesses the skills of applicators who have at least 800 hours applying protective coatings with airless spray.

Coating Application Specialist (CAS) Refresher Feb. 12

The CAS Refresher is an overview of surface preparation and application covered in the Body of Knowledge of SSPC-ACS 1/NACE No. 13 Applicator Certification Standard No. 1, Industrial Coating and Lining Application Specialist Qualification and Certification. It covers topics in surface preparation and coating application and is especially designed for employees that are new to the coatings industry.

Coating Application Specialist (CAS) Feb. 13 (Level 1); Feb. 13-14 (Level 2)

The CAS Certification Program is designed to certify individual craft workers who have experience and training in all aspects of hands-on surface preparation and coating application of complex industrial and marine structures. This is an exam only; no formal training is offered during this program.

Concrete Coating Inspector (CCI) Feb. 8-9 (Conc. Ctg. Basics); Feb. 8-12 (Tech. Level); Feb. 8-13 (Cert. Level)

The CCI program provides several different paths to certification, depending on the attendee's current level of experience; these can be found on SSPC's website. Concrete Coating Basics (CCB) provides basic training and is a prerequisite for individuals seeking CCI certification. The objective of the CCI program is to thoroughly train individuals in the inspection of surface preparation and the installation of protective coatings on industrial concrete structures and facilities.

NAVSEA Basic Paint Inspector (NBPI) Feb. 8-12

NBPI is an inspection course developed by Naval Sea Systems Command (NAVSEA) to train coatings inspectors to inspect critical coated areas as defined by U.S. Navy policy documents. These areas include (but are not

limited to): cofferdams, decks for aviation and UNREP, chain lockers, underwater hull, bilges, tanks, voids, well deck overheads, and others. This course is especially valuable, as it also provides the technical and practical fundamentals for coating inspection work for any steel structure projects other than ships.

Using SSPC PA 2 Effectively (PA 2) Feb. 7

This half-day workshop explains the key highlights of SSPC PA 2: Measurement of Dry Coating Thickness with Magnetic Gages. Students will learn to verify the accuracy of a DFT magnetic gage; measure the DFT of a

coating with Type 1 or Type 2 gage; and describe and implement the procedure to determine if the film thickness in a given area conforms to the maximum and minimum levels specified.

Protective Coatings Inspector (PCI)

Feb. 8-12 (Level 1); Feb. 8-13 (Level 2); Feb. 14 (Level 3)

PCI Level 1 has no prerequisites, but it is not an entry-level course. C1 is strongly recommended as a prerequisite for the PCI program. The objective is to thoroughly train

individuals in the proper methods of inspecting surface preparation and installation of industrial and marine protective coatings and lining systems on an array of industrial structures and facilities. Candidates should be prepared for an intense and fast-paced week of training with evening homework and study.

Students who pass the Level 1 exam and meet the prerequisites for Level 2 can take the written and hands-on Level 2 certification exams on day six. A passing grade on both exams is required to become a Level 2-certified inspector.

PCI Level 3 identifies and awards recognition to individuals who have in-depth knowledge in the inspection of industrial coatings. Those who pass the Level 2 exam and meet the prerequisites for Level 3 can take the Level 3 exam on day seven.

Protective Coatings Inspector (PCI) Workshop Feb. 11

This one-day workshop trains individuals in the proper methods and equipment for inspecting surface preparation and installation of industrial and marine protective coatings and lining systems on an array of industrial structures and facilities. It was designed as a supplement to students who have completed the PCI online program.

Protective Coatings Specialist (PCS) Exam Feb. 13

The PCS Certification Program identifies and awards recognition to individuals who have in-depth knowledge of industrial coatings technology. PCS certification demonstrates mastery in assessment of coatings systems, development of coatings specifications, surface preparation and coatings applications, economics of coatings, contract planning and management, coating failure analysis, and inspection.

Quality Control Supervisor (QCS) Feb. 14-15

The QCS program provides training in quality management for SSPC-certified contractor personnel, Technical Quality Managers (TQM),

PROUDLY MADE BY FINISHING BRANDS

and inspectors employed by SSPC-QP 5 inspection firms. It gives an overview of the quality management aspects of surface preparation, paint, coatings, and inspection operations that a QCS needs to know. It is highly recommended that persons attending the QCS course have recent inspection training or equivalent formal training and some quality control experience.

Basics of Estimating Industrial Coatings Projects

Feb. 11

This course covers the fundamentals of estimating industrial painting job costs including surface area calculations, labor and production rates, and equipment and material requirements.

Inspection Planning and Documentation *NEW!

Feb. 12-13

This course will teach coating inspectors how to plan inspections and document results of tests and inspections conducted. The training will emphasize carefully reviewing plans and specifications in order to develop a comprehensive inspection plan, as well as using forms to accurately and legibly document project-specific inspection and test results, non-conforming work, and rework. This course is designed for practicing coating inspectors already familiar with commonly-used coating inspection instruments and standards of practice.

Bridge Maintenance: Conducting Coatings Assessments *NEW!

Feb. 8-9

This course covers the fundamental inspections skills required to conduct a coating condition assessment of an in-service steel bridge. It provides a wide range of concerns that can affect the condition of the coating and presents a reporting and rating system, enabling the owner to make an educated decision on how to repair the damaged and deteriorated coating. The course also covers the basics of corrosion and coating types and characteristics related to steel bridges.

CCI Supplement: Determining the Level of Moisture in Concrete *NEW!

Feb. 14

This certification course covers the skills required to conduct moisture testing of concrete substrates prior to coating application. It defines and explains the steps for measuring moisture in accordance with ASTM Standard Test Methods. Candidates must have taken and passed the Certification Level of the SSPC's Concrete Coating Inspector (CCI) Program.

Evaluating Common Coating Contract Clauses

Feb. 10

This course will provide a basic overview of the clauses most common to coatings contracts. It follows the outline of a standard construction contract while also teaching students to identify the key provisions that

may be missing from contracts they receive.

Project Management for the Industrial Painting Contractor

Feb. 12-13
This course offers an introduction to project management concepts used on industrial painting projects. Attendees will learn about generating new business, reviewing contracts, navigating employee relations, and building safety into the job. The second day of this course involves an exam in which participants resolve real-world project management scenarios.

Coating Specification Essentials *NEW!

Feb. 11-13

This course presents an overview of the development of coating specifications, building upon CSI specification writing knowl-

COATINGS

Thickness Gauges

For All Your Coating Thickness Needs

Over 25,000 coating thickness analyzers installed world-wide providing precision measurement using microresistance, eddy current, magnetic, and XRF technologies

Rapid, reliable non destructive testing (NDT) solutions for:

- Coating inspectors
- General metal finishers
- Paint and powder coaters
- Pretreatment applicators
- Automotive and aerospace finishers
- PCB manufacturers

Measure a variety of coatings over ferrous and non-ferrous substrates

Zinc, Chrome, Cadmium, Anodizing, Paint

Pretreatments including Zr, Zn, ZnP, Ti, Cr, CrP

Thru-hole copper
Surface copper
Copper gauging

The analysis behind your success!

edge. It reviews the concerns that can affect project success, presents a checklist for developing coating specifications, and focuses on the technical requirements to consider when preparing specifications for coating work, with an emphasis on steel and concrete industrial and marine structures.

DOD FUNDING FOR SSPC 2014 COURSES

Under the DoD Corrosion Prevention and Control Program, funding for some of the courses offered at SSPC 2014 featuring GreenCOAT has been provided to train DoD, Army, Navy, Air Force, Marine Corps, NASA,

and Coast Guard personnel. For more information, contact Jennifer Merck at 877-281-7772, ext. 2221; or merck@sspc.org.

EXHIBITORS AT SSPC 2014

The following is a list of companies planning to exhibit at SSPC 2014 featuring GreenCOAT, current as of press time. For information on exhibiting, please contact Kate Jurik, SSPC Event Manager & Exhibit Sales Specialist, at jurik@sspc.org, or 877-281-7772, ext. 2211.

Comments Sought on OSHA Crystalline Silica Rule

The SSPC Government Affairs Committee is seeking comments from the industry to be submitted to OSHA regarding a new proposed rule on crystalline silica exposure limits.

On September 12, 2013, OSHA published a proposed rule in the Federal Register that addresses the permissible exposure of crystalline silica during construction work, suggesting a permissible exposure level of 50 $\mu\text{g}/\text{m}^3$, averaged over an 8-hour day.

In addition to the above, the proposed rule includes provisions for requiring medical exams of workers exposed to crystalline sili-

ca, as well as training of workers exposed to crystalline silica, covering the related hazards and how to limit exposure through use of personal protective equipment.

OSHA is reporting that the proposed rule will result in an approximate annual increase in operation costs of \$1,242 for an average workplace.

Further information on the proposed ruling can be found at www.osha.gov/silica. If interested, please submit your thoughts to Heather Stiner at stiner@sspc.org by November 4, 2013.

Training Courses

SSPC's Coating Application Specialist (CAS) Level 2 exam was held July 1–2 at the U.S. Coast Guard facility in Baltimore, MD. Proctored by Dan Buelk, there were five attendees.

The CAS Level 2 exam, conducted through IUPAT District Council 15, was also held July 9–11 at Bryan Painting and Decorating in Las Vegas, NV. The exam was proctored by Ken Seal (IUPAT/FTI), Gordon Green (IUPAT), and Anthony Kippen, and had 18 attendees.

Photo by Christina Calderon, Ehrlichman Photography

Midwest Chapter Holds First Golf Outing

SSPC's recently relaunched Midwest Chapter held its first golf outing on August 29 at Silver Lake Country Club in Orland Park, IL. The event brought out over 100 attendees and was a "huge success," according to chapter chairman Dan Hendrick of Madison Coatings, Inc.

Six students also completed SSPC's CAS Level 2 Exam, held August 3–4 at South Bay Sand Blasting and Tank Cleaning in San Diego, CA, and instructed by Terry New.

SSPC's Protective Coatings Inspector (PCI) course was held August 19–30 in Singapore. Abdul Quim (Bani) and Muniandi Dewadas instructed the course's 14 students.

Historic Chevelon Creek Bridge Contract Awarded

Technology Construction, Inc. (Prescott, AZ) won a contract valued at \$1,039,377.50 from the Arizona Department of Transportation to rehabilitate the historic Chevelon Creek Bridge in Navajo County, AZ.

This 102-foot-long by 14-foot-wide polygonal Warren pony truss bridge was built in 1913 by the Missouri Valley Bridge and Iron Company of Leavenworth, KS, when the State of Arizona did a truss replacement as part of the Transcontinental Route. The bridge was constructed for \$4,985, just \$515 shy of its \$5,500 budget, and was added

to the National Register of Historic Places on Dec. 8, 1983. Much-needed rehabilitation of the bridge had been put on hold in previous years.

The contract includes cleaning and recoating structural steel bridge surfaces with a DOT-approved, three-coat organic zinc-rich coating system. The contract also includes anti-graffiti coating application, as well as constructing new (replacement) decking, repairing truss and abutment surfaces, and installing new guardrailings. Containment is required to capture the bridge's existing lead-based coatings.

Allied to Paint 12 Bridges

The New Jersey Department of Transportation and Allied Painting, Inc. (Cherry Hill, NJ), SSPC-QP 1 and -QP 2 certified, have agreed on a \$4,857,024 contract to clean and recoat structural steel surfaces on 12 bridges throughout Camden, Salem, Gloucester, and Burlington Counties. The steel will be

power tool-cleaned to SSPC-SP 3, abrasive blast-cleaned to a Near-White finish (SSPC-SP 10), and recoated with an organic zinc-rich primer, an epoxy intermediate, and a polyurethane finish.

Class 1A and 3P containment according to SSPC-Guide 6 are required to capture the existing lead-bearing coatings.

The contractor will provide a NACE Level 1-certified coating inspector to perform quality control inspection services. The contract also includes epoxy waterproofing application.

Project Preview is compiled from Paint BidTracker reports.

Buying Guide

Coating Systems Buying Guide

More than 300 coatings manufacturers have listed suitable high-performance coating systems for steel or concrete in bridges, chemical & petrochemical plants, food and pharmaceutical plants, or any of 8 other types of industries, structures, or vessels for this year's Annual Coating Systems Buying Guide. Systems for half a dozen specialty functions are given as well. The Guide is intended as a resource for facility owners, third-party specifiers, contractors, and anyone else on the ground in a coatings project.

Using the Buying Guide

You can use the Guide to identify systems companies recommend for particular industries, exposures, substrates, and specialty functions. Contact details of every manufacturer listed in the Buying Guide are given on pp. 151-159.

The table of contents reflects the organization of the Buying Guide. Industries are arranged alphabetically, and the "Specialty Function" section appears at the end. Industry sections are then organized internally by combinations of exposure environment and substrate. Within each exposure environment and substrate category, companies are listed alphabetically; each listing includes the manufacturer's recommended system, by tradename (brand) or number and by generic type.

Readers should note that JPCL limited companies to selecting one system for each exposure and substrate and that many companies have more than one system for any given application.

The Buying Guide is in no way intended to replace the hard work of research and all the other efforts that go into specifying a coating system for a particular project. Nor do manufacturers' recommendations listed within this Guide constitute specifications or guarantees. The Buying Guide should get you to the manufacturers, whom you should always consult for proper use of their products.

Collection of Information

The Buying Guide is based on a questionnaire that was sent electronically to all coating manufacturers known to JPCL. No effort was made to verify information submitted. Companies that submitted the form by the print deadline appear in the pages that follow and in the on-line edition of the Buying Guide, which will be published later this year on www.paintsquare.com, our electronic home. The on-line version will include several search functions, including a search by tradename (brand) as provided by companies that completed the form.

Companies that have not submitted their data but would like to be listed in the on-line edition should contact Anita Socci, Directory Manager, asocci@protectivecoatings.com; 800-837-8303 or 412-431-8300, ext. 136.

EXPERIENCE

Nearly 17 years after pioneering the industry's most widely acclaimed platform system we continue to be the access solution of choice among the nation's top contractors.

QUALITY & SAFETY

A superior manufacturing facility with strict quality control methods and products that meet all OSHA & AASHTO requirements.

ENGINEERING & DESIGN

Complete in house engineering packages that have fast approval time and designs with accelerated installation in mind to save contractors expensive on-site labor costs.

INNOVATIVE & DIVERSE

With access as our only focus and with three different product lines we can provide solutions for any structure.

HIPPWRAP™ Containment is America's 1st Choice in Shrinkwrap Protection for all your blasting, coating, weather protection, and asbestos containment jobs. Whether you need to wrap a ship, storage tank, tower, building, aircraft, bridge, or any other steel structure, HIPWRAP can get the job done quickly and affordably.

And, HIPWRAP contains your bottom line. Our team of professionals are ready to visit your job site to conduct or oversee the efficient and proper installation of our durable, fire-retardant, seamless system that is sure to increase your productivity with less down time, minimal maintenance, and quick and easy clean up.

You can trust the HIPWRAP team for quality materials, a firm commitment to the customer, and the know-how and experience to get your next job done right. Call us today for a HIPWRAP quote.

HIGHLAND DRY-FALL SOLVENT BORNE COATINGS HAVE 12 YEARS
of field performance and studies show they meet or exceed the long-term performance of
competitor's 2-component spray, brush and roll and water-borne dry-fall systems!

2-K EPOXY • 2-K URETHANE • ACRYLIC • HITEMP DRY-FALL

Without sacrifice to durability or aesthetics, you can safely use spray application. Highland "Spray-Safe" Dry-Fall Coatings are powder dry within 10-20 feet from point of application and overspray wipes off surfaces easily without buffing or chemicals.

COATINGS FOR PEAK PERFORMANCE

Overspray Problems? We Have the Solution!

DAMAGE CONTROL: Costs are lowered, as much as 75%, through our fast, professional on-site overspray removal service.

COMPETITIVE PRICING: No charges, other than those for cleaning vehicles. Experience: Forty-four years of experience in removing: paint, epoxies, urethanes, roofing foam, asphalt, tar, concrete, industrial fallout, and most other contaminants, from all types of vehicles, boats, and aircraft.

STATE-OF-THE ART TECHNOLOGY: Our unique rubber pad eraser eliminates the use of: solvents, razor blades, buffing machines, sandpaper, rubbing compounds, and clay products.

IMMEDIATE ACTION: Skilled and uniformed technicians are quickly mobilized to any overspray claim site in the nation.

COMPLETE DOCUMENTATION: Signed pre-inspection forms and releases from satisfied claimants, that limit liability issues, along with vehicle photos.

Lighting solutions for all wet and hazardous areas!

WOLF Pneumatic Lamps,
safe for over 70 years!
Do **not** trail an electric cord!

New WOLF LED and Fluorescent
Ex lights, including low voltage tank
lighting kits, are now available!

- Sandblasting, Paint Shops
- Tank Cleaning and Coating
- Marine Tanker Fleets
- Chemical Plants
- Offshore Oil and Gas
- Fuel Storage Areas
- Aircraft Hangers
- Wet and Hazardous Areas

LS Blasters are built to shine in the most demanding steel cleaning environments.

From I-beams to plate to pipe, LS Blasters simplify your surface prep with the perfect combination of easy, precise shot control and durable performance. Our blast technology ensures optimum coverage and impact. It's also designed for easy maintenance and minimal downtime.

2013 and still going strong... 19 years of protection!

In 1994, THIOKOL® Novolac Epoxy was used to coat an underground navy fuel storage tank. Fourteen years later, a thorough inspection found the coating met stringent US Navy specifications. After another 5 years, the coating continues to protect.

THIOKOL® FNEC 2515

**When Tank Flexing is a Concern:
Epoxy Novolac modified with Polysulfide**

- Ideal for areas where flexing is an issue.
- Seals cracks and crevices as seen in storage tanks.
- For tank linings or as a secondary containment coating.

**Superior flexibility and chemical resistance
for the petroleum industry.**

PolySpec® THIOKOL®

**Call 888-797-0033 today
to find your coating solution...
or visit www.polyspec.com.**

FROM DETECTION TO CORRECTION:

Corrosion Probe, Inc. has the Most Concrete Coatings Experience and Expertise

**We Have More Concrete, Corrosion and Materials
Engineering Experience Than Any Other Firm**

- Corrosion Control Programs
- Civil/Structural Engineering/Design
- Non-Metals Materials Engineering
- Failure Analysis Services
- Coatings/Linings Specifications
- Field & Laboratory Testing
- Condition Assessment Services
- QC/QA Inspection Services

**Your Concrete
Rehabilitation and
Corrosion Control
Specialists**

The Takeaway

By Karen Kapsanis
JPCL

Up a Tree

before I realized I was using the wrong password. Invalid authorization. Invalid authorization. Invalid authorization. Yeah, I was hanging from a limb for a while there.

We need so many passwords these days because we need to get into so many electronic treehouses. There are the phones and the voicemails that go with them; the email accounts, personal and professional; the websites; the password-protected desktop, laptop, tablet. You name it. And remember the right password.

User name. Password.

Email address. Password.

User ID. Password.

Credit card. Password.

Bank account. Password.

Library card. (Library card? Yep.) Password.

And I have to periodically change those passwords to protect my accounts from hackers. But even that seems futile given how much of my information is available to any Internet service provider and....anyone the provider cares to share the information with....

So far, all I know is that I have occasionally protected my accounts from myself.

No wonder I feel like I'm up a tree, trying to get into someone else's treehouse.

Sometimes I think living in the information age is like trying to get into some kid's treehouse. That's because to get into a treehouse and into just about everything online or otherwise digital, you generally need to give the right password.

The proliferation of password-protected information is getting complicated. You're not supposed to use something anyone could easily guess, like your birthday or your home address, and you're not supposed to use the same password for any two accounts. At the same time, you need to use something that you can remember, but it usually has to have at least one upper case letter, a symbol, a number, and maybe five or six more unmemorable characters. Remember that. Right. If you're setting up a new account, the system you're trying to access will often rate your password for how easily it could be hacked, but not how easy it is to remember. Computers don't know that kind of thing.

I am writing this fresh off the experience of trying to log into one account using the password from another. I was kicked out three times
