Standards for Keeping Confined Spaces Safe

On May 1, OSHA published its final rule on confined space in the construction industry, scheduled to take effect on August 3. The scope (1926.1201) gives examples of confined spaces found in construction, including those often encountered in the painting industry such as tanks, silos, ship holders, boilers and penstocks. The remaining sections (1203-1211) provide specific requirements for working in these spaces. This new and welcome rule, which will raise the bar significantly for painting contractors working in construction, is long overdue.

After a tragic confined space accident in a penstock in Georgetown, Colorado, on October 7, 2007, claimed the lives of five painters and left three others injured, SSPC developed a Confined Space Fact Sheet in response to the U.S. Chemical Safety Board's final report about this incident at a hydroelectric power plant's penstock. Because the only comprehensive federal regulation governing confined space work up to that point was the General Industry Standard (1910.146), SSPC urged the industry to immediately accept and implement best practices and applicable elements of 1910.146 in order to avoid another tragic accident such as the one in Georgetown.

The new rule includes clear definitions of 47 key terms applicable to confined spaces in construction that need to become "household terms" for contractor safety personnel and their workers. These include: *hazardous atmosphere* (an atmosphere that exposes employees to the risk of death or other serious injury from such causes as flammable gas, vapor or mist in excess of 10 percent of its lower flammable limit; airborne combustible dust; atmospheric oxygen concentration below 19.5 percent or above 23.5 percent; atmospheric concentration of any substance for which a dose or permissible exposure limit [PEL] is published in other OSHA standards which could result in exposure in excess of its dose or PEL; any atmospheric condition that is immediately dangerous to life or health); *host employer* (the owner or manager of the property having the confined space); *acceptable entry conditions* (conditions that must exist in a space before an employee can enter); *attendant* (an individual stationed outside of the space to keep an eye on the employees working inside); *competent person* (standard OSHA definition for the person capable of identifying existing and predictable hazards in the work area); *controlling contractor* (the employer that has overall responsibility for construction at the site); *entry employer* (any employer who directs an employee to work in a confined space); *entry supervisor* (qualified person such as a foreman or crew chief, responsible for determining if its acceptable to enter a confined space or terminating entry when conditions are unacceptable); *rescue* (retrieving and providing

medical assistance to employees in a confined space); *rescue service* (persons designated to rescue employees); and *retrieval system* (equipment used for non-entry rescue).

In addition to these key definitions, many of the recommendations in SSPC's 2011 Fact Sheet have been adopted in the new regulation. Key "general requirements" include, but are not limited to: identification, by a competent person, of all the permit-required confined spaces where work will be done, prior to start of work; informing and training all exposed employees about the dangers of the confined space whose work is regulated by the standard in both a language and vocabulary that the employee can understand, including posting of warning signs; testing of the internal atmosphere for oxygen content, flammable gases and vapors and potential toxic air contaminants before an employee enters a space; continuous use of forced (clean) air ventilation; continuous or periodic monitoring of the atmosphere inside the space; having safe methods for entering and exiting the space, including use of a qualified or engineer-approved hoisting system; requirements for the "host employer" to notify the "controlling contractor" of the location of each known permit space, the hazards in the space, and precautions previously implemented; requirements for the "controlling contractor's" to get the historical information from the "host employer" and notify any entity entering the space(s) to pass along the information from the host employer and the necessary precautions; responsibilities for the "entry employer," who's sending workers into the space to do the work, to obtain the "controlling contractor's" information about the spaces and inform the "controlling contractor" of its permit space program; PPE, lighting requirements; first aid and CPR certifications; rescue procedures for summoning rescue and emergency services and rescue team qualifications; duties of entry supervisors; written permit space program; and training of each employee.

SSPC urges all owners and consultants to specify that any confined space work be done in accordance with this new standard (Subpart AA-Confined Spaces in Construction). Only contractors with comprehensive confined space work programs should be permitted to perform the work — no exceptions! Let's never again experience the tragic loss of life as a result of an avoidable confined space accident.

Michael Damiano
Director of Product Development, SSPC

Free Webinar Guides Painting Over Galvanizing

"Painting over Hot Galvanizing with Live Adhesion Testing," the latest free offering in the SSPC/JPCL Webinar Education Series, will be presented on Wed., July 15, from 11:00 a.m. to 12:00 noon, EST.

This webinar will explain how paint and galvanizing work in synergy, extending the corrosion protection of a structure by 1.5 to 2.5 times than painting or galvanizing alone. Participants will learn how this combined approach extends coating life and reduces the overall cost of maintaining a structure. Participants will be

Bernardo Duran III

eligible to receive credit from SSPC.

Bernardo Duran III, technical sales manager for AZZ Galvanizing Services, will present this webinar. Before joining AZZ Galvanizing Services, Duran was employed for six years by the American Galvanizers Association as a

corrosion engineer. He has a B.S. degree from the University of North Texas; is a NACE-certified Level 2 Coating Inspector; and is vice-chairman of ASTM A05.13 subcommittee (Structural Shapes and Hardware Specifications) for the A05 committee on Metallic-Coated Iron and Steel Products.

Registration, CEU Credits

This program is part of the SSPC/JPCL Webinar Education Series, which provides continuing education for SSPC re-certifications and technology updates on important topics.

SSPC is an accredited training provider for the Florida Board of Professional Engineers (FBPE), and Professional Engineers in Florida may submit SSPC webinar continuing education units to the board. To do so, applicants must download the FBPE CEU form and pass the webinar exam, which costs \$25. Register for this free online presentation at paintsquare.com/webinars.

Confined Space in Construction: Owners and Everyone Beware!

At long last, the Occupational Safety and Health Administration (OSHA) Confined Spaces in Construction Standard was issued on May 5, 2015. This new rule goes into effect on August 3, 2015. While similar to the general industry standard, the construction standard includes a major difference that will affect owners and contractors alike. The new rule requires detailed provisions requiring coordinated activities when there are multiple employers at the worksite. Coordination is required among the host employer, controlling contractors and entry employers.

- **Host employer** refers to the employer that owns or manages the property where the

construction work is taking place. There can be only one host employer.

- **Controlling contractor** is the employer that has overall responsibility for construction at the worksite. If the controlling contractor owns the property, then it is both a controlling employer and a host employer.

- **Entry employer** means any employer who decides that an employee it directs will enter a permit space. There can be multiple entry employers.

OSHA also added clarification to existing requirements in the General Industry standard including:

- Requiring that employers who direct workers to

enter a space without using a complete permit system, prevent workers' exposure to physical hazards through elimination of the hazard, or isolation methods such as lockout/tagout;

- Requiring that employers who are relying on local emergency services for emergencies arrange for responders to give the employer advance notice if they will be unable to respond for a period of time

(because they are responding to another emergency, attending department-wide training, etc.); and

- Requiring employers to provide training in a language and vocabulary that the worker understands.

With the August 3, 2015 effective date quickly approaching, owners, general contractors, subcontractors and others involved in construction (such as third-party inspection companies) would be wise to familiarize themselves with this new standard. The Confined Spaces in Construction Standard and additional information can be found on OSHA's Confined Spaces in Construction website, osha.gov/confinedspaces.

JPCL eBook Covers Abrasive Cleaning How-Tos

From set-up to safety, the technical ins and outs of abrasive blast cleaning are laid out by the experts in a handy, free new eBook from JPCL.

Abrasive Blast Cleaning features articles from JPCL on a variety of abrasive blast cleaning topics, and is designed to provide general guidance on the use and maintenance of blast equipment.

This downloadable 29-page book includes the following articles previously published in JPCL:

- "Setting Up Air Abrasive Blast Equipment";
- "Safety Considerations for Abrasive Blasting";
- "On the Time Between Blasting and Priming";
- "Shot Blasting: Tips on the Operating Mix";
- "Controlling Quality During Abrasive Blasting"; and
- "Keeping Workers Safe During Abrasive Blasting."

This eBook is the latest in a series by JPCL publisher Technology Publishing Co. Others in the series include:

- *Advances in Corrosion Control Technology*;
- *Dehumidification and Other Environmental Controls for Coating Projects*;

- *Overcoating Bridges and Other Structures*;
- *Selecting the Right Abrasive*; and
- *Ultra-High-Pressure Waterjetting*.

The entire series, as well as other technical reference materials, is available via free download from paintsquare.com/store.

Selecting and Sourcing

JPCL also offers free Buying Guide eBooks designed to provide guidance on selecting and sourcing coatings and materials for various structures and applications. Each book includes a technical article and information on suppliers for the appropriate

products. The series covers structures such as bridges, wastewater treatment facilities and transmission pipeline and includes eBooks on topics such as selecting abrasives and specialty-function coating systems.

UNIVERSITY OF AKRON GRADUATES FIRST CORROSION CLASS

The first baccalaureate corrosion engineering program in the U.S. has walked its inaugural class across the commencement stage and into careers as corrosion problem solvers.

Ten students received Bachelor of Science degrees on Saturday, May 9, from The University of Akron's Corrosion Engineering program, the university announced. The graduates, all Ohio natives, now have jobs waiting for them at companies including Marathon, ExxonMobil, Hendrickson, Corpro and BP, according to the university. One is heading to graduate school.

Launched in 2010, and developed at the request of the U.S. Department of Defense Office of Corrosion Policy and Oversight, UA was the first university in the U.S. to offer a Bachelor of Science degree in corrosion engineering. The university plans to expand the program to include Ph.D. and M.S. degrees in the future. About 100 students are enrolled in the program, with about 50 incoming freshman expected in the fall, a university spokesperson told *PaintSquare News*.

The program was initiated with a goal of preparing corrosion engineers to tackle the growing corrosion problem by bridging the work of scientists who research and develop

technology with technicians who apply that technology in the field, according to the University. The five-year program blends traditional science and engineering with a strong corrosion-specific core and integrates management courses and cooperative education experiences.

"The University introduced the corrosion engineering program as a response to one of our nation's most costly and crippling issues, aging infrastructure, and a growing demand from corporations and potential employers," said Dr. George Haritos, dean of the College of Engineering.

Corrosion costs the country an estimated \$400 billion per year, according to the University.

Richard Hays, deputy director of the DoD's Office of Corrosion Policy and Oversight, sat on stage at the commencement ceremony to honor the first class of graduates.

"We are extremely proud to see our students, the country's first, develop and execute solutions that address corrosion and meet the intentions and expectations of the program and their employers," Haritos said.

The University of Akron graduated the first 10 students from its Corrosion Engineering program. First row, from left: Dr. George K Haritos, dean of the College of Engineering; Jacob Sines; David Waligorski; David Keith Dahlstein; Kyle Platt; Stephen Ball; Dr. H. Michael Cheung, chair of the Department of Chemical and Biomolecular Engineering. Back row, from left: Dr. Edward Evans, associate professor of chemical engineering and associate chair for education; Ian Coleman; Derek Coy; Stephen Callow; and Zackary Lerch. Not pictured: graduate Timothy Robertson. Photo courtesy of The University of Akron.

"Paris Bridges Divorce Love Locks" (June 2)

Cracking down on a longtime romantic ritual, the Paris City Council began to remove tens of thousands of padlocks lovingly clicked closed on spans over the Seine on June 1.

What began in 2008 as a charming symbol of affection (completed by tossing the lock key into the river) has left a ponderous, rusting mass of unsightly steel tonnage that damages the integrity and appearance of the bridges in question, officials say. The locks heap weight and additional corrosion on the bridges, and the keys and assorted debris from the locking rituals clogs the Seine below.

A year ago, police evacuated the historic Pont des Arts footbridge over the river after a section of railing collapsed under the weight of the locks. The bridge carries more than 700,000 locks. Meanwhile, the ritual has spread to other bridges, creating two major concerns for the city: "degradation of property heritage and a risk to the safety of visitors, Parisians and tourists," the Paris City Council said on its website.

WHAT'S GOT US TALKING

(PaintSquare News Weekly Poll, May 10-16)

A proposed Iowa law would require companies planning mega-projects to obtain agreements with 75% of the affected property owners before seeking eminent-domain authority. Good law or bad law?

GOOD LAW. 80%
BAD LAW. 20%

Rodney White: *"What is needed are stricter rules regarding the implementation of eminent-domain. Too many projects are put forth, trampling on the property rights of individuals to further the interests of private companies. Pressure to grant right-of-way for installation of a pipeline is one thing; there have been cases of seizing private land, for instance, to build a shopping mall, under the guise of 'expanding the tax base to benefit the community' — wrong on so many levels."*

Mark Bowen: *"Making it 90% would be an even better law."*

STUMPER OF THE MONTH

(PaintSquare News Daily Quiz, May 18)

In what waters did an offshore platform disaster occur, resulting in the death of 167 men?

- a. Atlantic Ocean off Newfoundland
- b. Gulf of Mexico
- c. North Sea
- d. South China Sea

Answer: North Sea. Deaths and damages resulting from the explosion and fire on the offshore platform Piper Alpha resulted in numerous changes to improve safety, including use of fire protection with intumescent coatings.

On Preparing Galvanized Steel for Overcoating

WHAT IS THE BEST METHOD FOR PREPARING NEWLY GALVANIZED STEEL TO BE OVERCOATED WITH AN EPOXY SYSTEM?

Larry Muzia

Exceletech LLC

Although there are several methods used in our industry, my vote is either let the galvanizing weather for several months or brush-blast using a fine abrasive and a journeyman behind the nozzle who does not overblast and addresses 100 percent of the surface area with the blasting procedure. In the old days a vinegar wash (5 percent glacial acidic acid) was common; however, allowing the acid to dry created as many problems as it solved. These type of acid salts are hard to remove and will cause blistering and delamination if a coating is applied over them. Assuming an oil post-treatment was not used after the galvanizing operation, there are direct-to-new-galvanizing coatings on the market. These DTM coatings are generally formulated to exhibit low film stress and therefore will provide some level of performance, remembering that the new galvanizing's top metallurgical layer has a very high initial pH and is very dense. Applying a highly cross-linked coating film over new galvanizing, one should follow caution to achieve adequate adhesion for proper service life.

Winson King

PennDOT

Remove oil and surface contaminants by SSPC-SP 1, "Solvent Cleaning," perform SSPC-SP 7/NACE No. 4, "Brush-Off Blast Cleaning," preferably with fine garnet, then remove dust and overcoat ASAP during same shift.

Om Prakash Jat

Kaefer Saudi Arabia

Oil and grease must be removed with a strong detergent, followed by thorough fresh water rinsing. The entire area must be (high-pressure) fresh water-cleaned to remove salts and other impurities. When the surface is dry, sweep blast with a mineral abrasive to a uniform, rough surface for good coating adhesion. Remove dust and clean the surface prior to painting.

Marco Antonio Alvarado Meneses

Sherwin-Williams Perú

I agree with Winson. Remove oil and grease according to SSPC-SP 1. It is necessary to carry out "the water-break test," then, sweep-blast is advisable (fine abrasive and low pressure in order not to remove zinc). Remove dust by air blow-down, and overcoat.

Simon Wadsworth

Flint and Neill Limited

In accordance with the paint manufacturer's instructions, as always! U.K. practice would be to use either a mordant solution of inhibited phosphoric acid, commonly called "T-wash," to etch the surface before painting or, if a high-build primer is used, low-pressure sweep-blasting to provide a profile of 20 microns.

Tolga Diraz

Carboline Turkey - Bursa Plant

As we are coating professionals, I believe our first priority is to follow industry standards and collective recommendations coming from reliable sources like technical societies and/or opinions of industry gurus published in respected magazines. Therefore, I primarily suggest using

ASTM D6386, "Suggested Specification for Preparing Hot-Dip Galvanized Steel Surfaces for Painting," and SSPC-SP 16, "Brush-Off Blast Cleaning of Non-Ferrous Metals." The former is more general, and the latter deals with brush-off abrasive blasting of galvanized material. They are especially useful if you are writing a spec.

Clyde Morgan

Burns & McDonnell

I use SSPC-SP 16. It addresses several issues not found elsewhere, including wet staining, chromates and blasting material hardness to prevent damage to the galvanized material.

Trevor Neale

TF Warren Group

As stated above, SSPC-SP 16 provides the answers and methods for preparing non-ferrous metal. Following that with an alkali-resistant primer such as epoxy will ensure long-term adhesion and performance.

Empty Jasson

Hai Phong

Use detergent cleaning to remove oil and grease. Conduct fresh water washing to remove dust and other contamination. Create roughness on the surface to increase adhesion with sandpaper or light blasting.

SSPC Accepting 2015-2016 Structure Awards Nominations

SSPC is currently accepting nominations from its membership for the annual Structure Awards. These awards are given to recognize the work of teams of contractors, designers, end users and coating manufacturers for excellence on particular coatings projects. The awards will be handed out during SSPC 2016 featuring GreenCOAT, which will take place January 18 to 21, 2016, at the Henry B. Gonzalez Convention Center in San Antonio, Texas.

In recognition of the importance of the Structure Awards, the awards will be presented at the annual Awards Luncheon on Monday, January 18, 2016. The winning structures will also be featured in a photo essay in the *JPCL* after the conference.

SSPC is seeking nominations for all types of structures, including bridges, tanks, concrete structures and industrial and commercial facilities. Descriptions of the individual Structure Awards are as follows.

- **E. Crone Knoy Award:** For outstanding achievement in commercial or industrial coatings work that demonstrates innovation, durability or utility. The qualities that may represent outstanding achievement

in this area include excellence in craftsmanship or execution of work, use of state of the art techniques or products to creatively solve problems or provide long-term service.

- **Charles G. Munger Award:** For the outstanding industrial or commercial coatings project demonstrating longevity of the original coating. The structure may have had spot repairs or overcoating with the original coating still intact.

- **William Johnson Award:** For outstanding achievement demonstrating aesthetic merit in industrial or commercial coatings work. The qualities that are considered for aesthetic merit include color, gloss or texture, or that the coating on the structure compliments the environment while enhancing the structure itself. The coating may represent a theme, an object or a specific graphic design.

- **George Campbell Award:** For outstanding achievement in the completion of a difficult or complex industrial or commercial coatings project. The qualities that may represent achievement in a difficult or complex structure may include work occurring in harsh or extreme environmental conditions; work completed

under strict time constraints; work done with limited access or in high traffic areas; work on a structure with complex structural components; or lastly a project that requires coordination with multiple trades or sub-contractors.

- **Military Coatings Project Award Of Excellence:** In recognition of the exceptional coatings work performed on U.S. military ships, structures or facilities.

With the exceptions of the Charles G. Munger Award for longevity and the Military Coatings Project Award of Excellence, the work on the structures must have been completed between July 1, 2014, and June 30, 2015.

If you have any questions or if you want a copy of the nomination form, please contact Terry Sowers, SSPC Director of Member Services, at 1-877-281-7772, extension 2219, or email sowers@sspc.org. SSPC must receive your award nomination submission by October 1, 2015.

Please note that a representative of the structure owner must be willing to attend the awards luncheon to accept the award and give permission for the information to appear in the *JPCL* photo essay.

SSPC Training Roundup

• From Feb. 23 to 27, South Bay Sandblasting & Tank Cleaning in San Deigo, Calif., hosted SSPC's NAVSEA Basic Paint Inspector (NBPI) course. Johnny Sanchez and Gordon Kuljian instructed the course's 16 students, who were (in no particular order, above): Eddie Barbosa, Steve Clarke, Milton Collier, Casey Conrad, Timothy Deverin, Simon Gomez, Alexander Kazes, David Kijowski, Anthony Kopesky, Austin Long, Robert Martin, Jesus Nguyen, Bryan Nichols, Cory Rosillo, Philip Zamaripa and Mitchell Long.

• SSPC's Concrete Coating Inspector (CCI) course was held March 16 to 21 at the Australasian Corrosion Association's facility in Melbourne, Victoria, Australia, with Bob Murphy and Glynn Loftin instructing the course's 20 students (below). This was the first time that the CCI course was presented in Australia.

"In my opinion the class was a success," said Murphy, the product development manager, water, at The Sherwin-Williams

Company. "The students were engaged and very appreciative that this was the first class of it's kind that dealt with concrete ... I was appreciative of the feedback given and the opportunity to share what I have learned here in the U.S. and learn more about the issues that are experienced by others in the industry in Australia."

Graham Carlisle, a technical lead for IAS Group who attended the course, commented: "The instruction provided left the students feeling enlightened, as the accumulated knowledge of both the instructors and the course content compiled by SSPC, with inserts from the International Concrete Repair Institute (ICRI), was passed from one generation of concrete coating instructors to the next. A fantastic value add for all that may be involved in any concrete coating project, both personally, for any associated organization and for our industry at large."

• Instructors Michelle Mercado and Gordon Kuljian led the SSPC NBPI course from March 23 to 27 at the Pearl Harbor Naval Station in Pearl Harbor, Hawaii. The 11 students who attended the courses were (in no particular order, top right): Rommel Baldovino, Romeo Esteban, Curtis Evans, Jaymi-Lee Gould, Myles Kim, Duane Kizsak, Dennis Mantanona, Alexander Racki, Cheryl Yamanaka, Toua Lor and Sampson Salais.

• STMCoatech in Sakarya, Turkey, was the host site for SSPC's Protective Coatings Inspector (PCI) course from April 16 to 21. Instructors Seda Omercikoglu, Deniz Tok and Mohamed Elhamalawi taught the course for the 12 attendees, who were (in no particular order, bottom right): Tuna Aksa, Gurkan Cep, Ozgur Guney, Emre Gursoy, Yasar Merter Hayirgor, Erdal Kahya, Ismail Kaynar, Ferhat Ozvan, Ekram Mete Uyal, Atok Kumral Vesikalik, Zeynel Abidin Yasar, and Hasan Ali Yilmaz.

One of the students of the PCI course noted: "I have been working in industrial coating and application for 16 years. My field experience provided me with practical knowledge, but after the completion of SSPC's course, I now have a much deeper sense of the theoretical side of surface preparation and coating application. I truly appreciate the instructors' care and patience with the program to ensure the students understood all of the course information. Thank you, SSPC and STMCoatech, for such quality training."

Problems with Galvanizing

By Jayson L. Helsel, P.E., PCS, KTA-Tator, Inc.
Richard A. Burgess, PCS, KTA-Tator, Inc., Series Editor

Hot-dip galvanizing, as the name suggests, consists of dipping pieces of steel into a molten zinc bath. The molten zinc reacts metallurgically with the steel and forms four distinct layers growing outward from the steel surface. The layers consist of various alloyed combinations of zinc and iron beginning at the steel interface with a layer composed of 75 percent zinc and 25 percent iron (gamma layer). The intermediate layers (delta and zeta layers) contain progressively more zinc (90 and 94 percent, respectively) until the formation of a top layer (eta layer) of nearly pure zinc. The galvanized coating forms a strong bond to the steel that may be in the range of several thousand pounds per square inch (psi).

Galvanized steel is often not painted, because the service life of galvanizing alone typically exceeds that of conventional protective coatings. But when paint is applied to galvanizing, it is called a "duplex system." The service life of a duplex system has been reported in some studies to be a factor of 1.5 to 2.3 times the sum of the individual service lives for galvanizing or painting alone. The factor applied depends on the exposure environment; for example, a mild exposure will have a higher factor (longer service life) and a more severe exposure a lower factor.

This column will explain the basics behind galvanizing, including the proper surface preparation and steel selection techniques, commonly used standards and testing procedures and problems that can arise on galvanized steel structures. A case study on a galvanized steel bridge will be cited as an example of

Fig. 1: Galvanized members display white zinc corrosion product on surfaces. Other areas are a uniform dark gray color that is characteristic of galvanizing on reactive steel. All figures courtesy of KTA-Tator, Inc.

some of these problems, with possible solutions discussed.

Preparing Galvanized Steel

Painting galvanized steel requires proper surface preparation, particularly for new galvanizing that has not yet been exposed to weathering elements. One concern with painting new, galvanized steel is whether various post-treatments have been used. Galvanized steel is sometimes post-treated to stop the reaction between the iron and zinc or to slow the subsequent oxidation of the zinc surface. The most common post-treatments are water quenching, chromate quenching and phosphating. In water quenching, freshly galvanized steel is dipped into a water bath to help accelerate the cooling process and stop the reaction between the iron and zinc. Consequently, water often becomes contaminated with oil dirt, which gets deposited on the zinc surface.

These contaminants will interfere with adhesion if they are not adequately removed and paint is later applied.

Chromate quenching is primarily used to prevent the formation of white rust or wet storage staining when galvanized steel is closely packed during transportation or storage. White rust refers to the zinc salts that begin to form on the zinc surface as the zinc is oxidized through atmospheric exposure. Wet storage staining is an accelerated oxidation of the zinc surface from exposure to relatively high concentrations of moisture and oxygen that are trapped between pieces or sheets of steel that are closely stacked. Although the chromate treatment can prevent this oxidation, it will also interfere with adhesion if paint is later applied. Chromate treatment may be desired if painting is not intended after galvanizing, as the treatment typically results in a more uniform appearance of the zinc

surface as it oxidizes and weathers. The “shiny” appearance of new galvanizing always becomes gray, duller and mottled to some degree over time as it weathers.

Phosphating steel after galvanizing forms a non-reactive zinc phosphate layer over the zinc surface. The surfaces would first be cleaned and degreased, and then immersed in a phosphating solution. The phosphating solution both prevents corrosion products from forming and promotes good adhesion with a subsequently applied paint layer.

If new galvanized steel is to be painted, it must first be cleaned and degreased in accordance with SSPC-SP 1, “Solvent Cleaning.” Following solvent cleaning, surface preparation for new galvanizing generally consists of application of a wash primer, chemical treatment or cleaning according to SSPC-SP 16, “Brush-Off Blast Cleaning of Coated and Uncoated Galvanized Steel, Stainless Steels, and Non-Ferrous Metals.” If a chromate treatment was used, the surfaces must be thoroughly cleaned and tested for chromate compounds to ensure their removal. Ideally, specifications for galvanized steel should not allow chromate treatment and instead should specify a phosphating post-treatment. The phosphating passivates the zinc surface and produces a conversion coating layer that is ideal for the application of a coating system.

Failure to properly prepare galvanizing for painting often leads to poor coating adhesion and subsequent failure. But even if galvanizing is not intended for painting, problems can develop with the zinc layer if the hot-dip process results in too thick of a layer.

Steel Selection

One key factor in avoiding an excessively thick zinc layer, in addition to the time (duration) of dipping, is proper steel selection. The chemistry of the steel influences appearance and other properties of the galvanizing. Trace elements in the steel such as silicon and phosphorus affect the galvanizing process as well

as the structure and appearance of the coating. Steels with these elements outside of the recognized ranges are known as reactive steels. General guidance for steel selection recommends levels of carbon less than 0.25 percent; phosphorus less than 0.04 percent, manganese less than 1.35 percent, and silicon levels less than 0.04 percent or between 0.15 and 0.22 percent.

Silicon may be present as an element in many steels commonly galvanized even though it is not a part of the steel's controlled composition, because silicon is used in the steel reduction process and is found in continuously cast steel. Both silicon and phosphorous act as catalysts during the galvanizing process, resulting in rapid growth of zinc-iron alloy layers. When the silicon content exceeds 0.22 percent, the steel is classified as reactive steel. An additional item of note with reactive steels is that the galvanizing often has a matte gray finish rather than the typical shiny surface (Fig. 1, p. 15).

A commonly specified standard for hot-dip galvanizing of structural steel, ASTM A123, “Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products,” specifies a minimum zinc thickness of 3.9 mils or 100

microns (for Coating Grade 100). Note that the Coating Grade is equivalent to the zinc thickness in microns as defined for specific thicknesses ranging from 35 to 100 microns (1.4 to 4 mils). Although it is not unusual to find zinc thickness on structural steel of several mils up to approximately 10 mils, widespread thicknesses far in excess of this range are a good indication that the steel may be reactive. As will be described in the following case, the excessively thick zinc layer that is often produced when galvanizing reactive steel tends to be more brittle with a lower cohesive strength than would typically be expected. Depending on other factors, such as the exposure environment, these diminished properties can lead to the cohesive separation of the zinc layer as described for flaking zinc.

Unfortunately, industry standards for specifying steel do not limit the silicon content in steel for purposes of galvanizing. For example, ASTM A36, “Standard Specification for Carbon Structural Steel,” and ASTM A709, “Standard Specification for Structural Steel for Bridges,” both limit the silicon content to a maximum of 0.40 percent, which is

Fig. 2: The galvanized zinc layer was cohesively delaminating along many stringer and floor beam flanges. Delamination typically occurred in areas where surfaces had heavy white corrosion deposits.

well above the recommended level for galvanizing.

Problems With a Galvanized Steel Bridge

One such case where galvanizing was reported to be "peeling" from the steel occurred on a small bridge near the east coast. This simple two-lane structure was composed of galvanized stringers and floor beams supporting a galvanized road deck with a small truss structure above. The bridge crossed over a small stream, which ran about 10 feet below the bottom of the structure.

An investigation at the site observed that galvanizing was peeling or delaminating along the bottom flange of many stringers and floor beams. Examination found that the majority of the zinc layer was cohesively delaminating from the structural steel members. The

galvanizing thickness, where intact, measured with an electronic gage, was 16 to 20 mils on many of the members. Where zinc was peeling, the remaining zinc thickness was typically 1 mil or less (Figs. 2 and 3, pp. 16 and 18).

The overall assessment of the structure noted white corrosion over parts of the bottom of the galvanized deck and supporting galvanized structural steel. At areas of heavy white corrosion, red corrosion was also observed, indicating that the steel substrate was rusting. The areas of corrosion of the galvanized deck showed a clear pattern of moisture penetration through the deck as evidenced by the amount of corrosion present at weep holes and seams of adjoining deck panels. Another obvious pattern was less corrosion in the outside bays and more corrosion in the middle bays, indicating that water penetration

was greater toward the middle of the structure.

The degree of corrosion of the structural steel stringers and floor beams generally corresponded with the degree of corrosion of the galvanized deck. The white corrosion on stringers was typically heaviest directly below where the deck was corroded and likely leaking. Another observation was that galvanized surfaces without much corrosion were typically a matte or uniform darker gray color.

Corrosion products (white zinc salts) begin to form on a zinc surface as soon as it is exposed to the environment. These products are a result of the zinc reacting with atmospheric oxygen, carbon dioxide and water. Generally, the initial zinc compounds that are formed are water soluble, porous and loosely adhered to the surface. Over time, these

compounds are typically converted to a tightly adherent water insoluble film that serves to protect the zinc surface from further corrosion. However, when the environment exposes the zinc to moisture/water very frequently, the conversion to a tightly adherent film does not occur and the zinc continues to corrode, eventually consuming the zinc and allowing corrosion of the steel (red corrosion).

The moderate to heavy degree of white corrosion on the under deck steel of the structure indicated frequent exposure to moisture. By contrast, no particular issues were noted with the galvanizing on the above deck truss. The galvanized surface of the truss had the appearance of typical weathered galvanizing where an adherent and protective film had developed.

General information regarding problems such as zinc peeling and flaking is published by the American Galvanizers Association (AGA). AGA indicates that flaking, where most of the zinc layer cohesively delaminates, occurs when the outer three (of the four) galvanized layers detach from the first layer. Flaking may occur when the zinc thickness exceeds 10 mils and becomes brittle. The remaining thickness of zinc left on the steel where layers of zinc alloy have flaked off is

typically near zero, indicating that only the gamma layer is left on the steel. Peeling of galvanized coating, which is a different type of problem, happens when the outer free zinc layer separates from the intermetallic layers. Peeling can occur when newly galvanized steel cools extremely slowly or if the steel is exposed to high temperatures for prolonged periods.

A peeling zinc layer as described here is not necessarily related to the total galvanized zinc thickness.

Results

A review of material test reports for the steel used in the problem bridge structure showed that the maximum silicon content of the steel ranged from 0.24 to 0.41 percent. Additional metallurgical testing of galvanized steel samples that had been removed from the bridge confirmed a high silicon content of the steel with results of 0.40 percent. The high galvanizing thicknesses measured were consistent with what would be expected for reactive steel.

The delaminating galvanized zinc layer on the bridge was determined to be the result of a combination of an aggressive exposure environment beneath the structure due to frequent moisture exposure, in combination with a decreased cohesive strength of the galvanized zinc layer due to the high thickness that resulted from using reactive steel. The continued corrosion and degradation of the zinc due to exposure conditions resulted in accumulating stresses that eventually caused the zinc layer to cohesively delaminate near the steel surface in many areas.

The remaining zinc layer where delamination had occurred was not considered to be adequate to provide long-term corrosion protection of the structural steel. The recommended repair option was spot surface preparation at areas of delaminated zinc to remove loose galvanizing and any red corrosion of the steel. A spot organic zinc-rich primer was recommended followed by an epoxy coat to the entire repair area. An additional epoxy or urethane finish coat was recommended to provide further protection.

Conclusions

Hot-dip galvanizing, when used in place of or in tandem with protective coatings, can provide a long service life for steel structures, but the performance of the galvanizing depends on a number of factors, including preparation and steel selection. For steel that will be placed in aggressive exposure environments, as seen in the bridge case discussed in this column, the factors become all the more important — otherwise, a loss in service life and potentially costly repairs can result.

Risky Business

EXPLORING THE EMERGING NECESSITY OF RISK MANAGEMENT

By Deidre Dunkin, Dunkin & Bush, Inc.

Does your company have a risk manager or someone who has assumed this role over the past several years? Is this person someone who was promoted from another position within your company to focus solely on risk management? Or is your company president, vice president, CFO or safety director assuming the additional job duties? All of these options are viable as each managed some aspect of risk long before risk management became a recognized profession.

While this type of transition is becoming more common for contractors, let's think about what we are asking of the individual we put in this position. Is this overarching position structured correctly within your organization? Have you set up this person for success with the proper authority and direction? Or, have you set them up for friction with those charged with potentially opposing objectives? The initial structure is critical as its failure leaves your organization vulnerable to a number of threats.

What Exactly Is Risk?

Commonly and mistakenly associated with safety alone, risk is a much broader concept. Typical duties of a risk manager include insurance placement for potential threats that the company cannot absorb or would like to insure against, with the primary driver being the insurance requirements of our customers. The risk manager should work closely with a company's legal counsel, whether in-house or outside, to help minimize exposure to the organization ranging from contractual risk, to environmental risk, to risks associated with in-house human resource policies. Other important duties of a risk manager include developing and directing a company-wide risk prevention program, conducting regular

© iStockphoto/alphaspirit

assessments of all company policies and procedures, and ensuring regular communication and collaboration between management, employees and business partners. Ultimately, though, the single most important duty of a risk manager is to educate and effect cooperation among the organization's departments that may be independently managing the same risk, but from a different perspective, such as workers' compensation, payroll, safety, contractual and/or legal, without any awareness of another department's perspective on that risk. When that connection is made between a company's various departments, the resultant strategies are the most formidable foe to any threat the company may face.

Operations

By definition, operations are at the core of what we do and the basis of how the company generates profits. We are not in the business of risk management but rather of performing quality industrial services in a safe, efficient and profitable manner that suits the needs of our customers, while also providing economic security for our employees and a reasonable return for our investors. In light of these often competing interests, the manner in which management develops policies and procedures and provides the necessary direction, training and resources to support them, defines how our employees perform their work, and whether or not it is consistently true to the core values of our customers and the company.

With this foundation in mind, let's think about our daily actions and whether we are truly transparent with our employees in our risk management approach. Do our field employees know that the company contemplates risks beyond environmental and safety? If they do, have we actively communicated our diligence in ensuring stable employment and a safe workplace? Do our managers truly understand the big picture and the impact of safety violations, fines, claims and

lawsuits and how they affect our ability to be competitive? Do they understand contractual risk and warranties? Do we track and communicate that what we thought was a profitable job has now lost money and why?

Human Resources

Depending on how many employees you have and what your turnover may be, your human resources department plays a significant role, ensuring that the employees representing the company are screened and hired correctly, oriented to the company, and trained and tested to its policies and procedures. In our company, before an employee even begins work, HR conducts a number of pre-qualification tests and even once they have successfully completed those tests and any internal orientation, more training is required so they may obtain specific certifications required by our customers. At this point in the process, it is imperative that the HR department, safety, and risk management are working cohesively to coordinate standardized and consistent pre- and post-employment training and orientations, locally and regionally.

In addition to the responsibility associated with executing a company's hiring

processes, the responsibility of properly terminating an employee so as to reduce risk to the organization also lies with the HR department. In such an instance, the relationship and collaboration between the HR department, operations, the risk manager and the company's legal counsel become crucial. The failure of an organization to properly terminate an employee can lead to the risk of wrongful termination claims, discrimination

allegations, EEO claims, or hostile work environment claims, just to name a few. How a company handles all aspects of employment, from hiring to termination, significantly impacts employees' perception of the company, which can in turn effect the overall risk faced by the organization in the aspects of hiring and firing.

Safety Department

Safety departments and safety directors have been a "natural" landing spot for broader risk management primarily due to employee interaction with orientation and safety training and the simple fact that workers' compensation claims tend to be a major focus area in our high-risk industry, driving our biggest insurance concern.

Although this may initially make sense, a safety director or safety department should not be expected to bear the entire burden of evaluating any and all potential risks to a company, particularly if it involves a non-safety issue such as contract compliance, employee termination or quality assurance; nor should they be expected to take on the role of mediating between the departments analyzing risk from the from their various perspectives. Rather, just

© iStockphoto/Ugurhan Betin

as any other department, safety should work closely with risk management and the other departments to ensure that all aspects of any risk encountered are properly and fully addressed to reduce exposure.

Security and Property Control

Although many companies do not employ security personnel, the safety of our employees, property and equipment are paramount to ensuring our operations run smoothly. Loss or theft will significantly impact our ability to do our jobs, as will a crisis situation for which we are unprepared. Does your company have a crisis management program in place? Does it address the role of each department in the event of a crisis? Have you tested the program? Do you modify the program when key personnel change? Conducting a mock crisis-management exercise can demonstrate in a very clear way the weaknesses in your organization and how the weaknesses should be addressed to ensure you are fully prepared in the case of a true emergency. Such an exercise can also demonstrate how departments that may typically tend to work independently need to pull together to mitigate risks associated with potential injuries, violations, investigations and other similar issues, whether in crisis mode or not.

Quality

Similar to risk management and with an average claim ranging from \$500k to \$1M, quality assurance/quality control (QA/QC) has quickly become a new focus for contractors. And, just as with risk management, buy-in of an organization, from management down to employees, is imperative to ensure the success of a QA/QC manager and/or department in performing its job. Safety and QA/QC must be able to collaborate with other departments within the organization in order to be successful, particularly pertaining to operations. Because safety and QA/QC, along with risk management,

report to upper management, cooperation with operations and other departments can be stunted if not properly structured and supported by upper management.

Commonly, responsibility for quality falls with the project manager or the superintendent. Although these individuals are closer to the project and theoretically have a much better grasp on the required submittals for the job, their primary focus is on schedule, manpower and execution of the work. As a result, the risks associated with quality often do not become realized until a warranty claim is made by the customer due to a failure to follow a specification or other contractual requirement and no one can locate the relevant documentation to defend the claim.

The following are some focal points that should be reviewed by QA/QC and shared with risk management and operations to avoid future claims.

- Materials ordered directly from the submittal: Are they the right materials for the job? Were they the materials identified in the bid?
- Materials verified when they arrive at the job site: Is the quantity correct, i.e., do we have enough of part A and part B? Are they within their shelf life? Do the drums or cans appear to be in good shape?
- Planning meetings: Are they occurring? Is there a project control plan in place?
- Visual inspections and testing: Has someone surveyed the asset to be coated or lined to determine if it is in good shape? Is your visual assessment the same as what was identified in the contract documents and what was assumed in the bid?
- Photographs: You can never take too many photos! What did the item look like when it came into your possession to be coated in the shop? How was it packaged if delivered to your yard or site? What did it look like when you packaged it and sent it back to the customer?
- Document testing, inspections and cross-checking to specifications: Do

you customize your QA/QC reports and forms for significant jobs to spell out the applicable specifications? Do you do random testing of the QA/QC reports to the specification and the manufacturer's data sheet?

- Standardized documentation: Is your QA/QC documentation filed and catalogued consistently among jobs, regions and trades? Is it easily retrievable by other departments, i.e., contracts, operations or legal, should it be needed? Do you have a quality management system in place to ensure standardization of your QA/QC documentation?

Ownership, Admin and Legal Department

Do your employees have the authority to stop work for safety or quality concerns? Do they have enough information about the applicable contract to ensure they are meeting the customer's requirements? Do they know what the specifications for a particular project require? Do they understand the consequences of continuing work despite our customer's failure to timely pay us? Do they have knowledge of the risks associated with not properly documenting the performance of a mediocre employee?

What keeps me up at night is not necessarily ensuring that our 72-year-old company continues to make money, but that it continues to provide for and feed over 500 families. To do this, the organization as a whole must continually focus on communication between all of its departments so as to provide those on the front lines with all of the tools necessary to most efficiently, safely and profitably meet our customer's needs, from legal to financial to safety to quality control to human resources. This is where risk management as a separate entity, whether through an individual or a department, within an organization, plays an integral part in the health of a company.

Conclusion

Of course, we are not by any means suggesting that a risk manager or a risk management department does it all. The overall risk to the organization is not any one person's or one department's responsibility. Managing risk is everyone's responsibility. A risk manager is simply someone with that ever-present focus in mind who can act as a conduit between departments that may typically only be seeing a part of the picture.

I challenge you to evaluate your company's true risk, and to promote a risk management culture throughout your company. Strive for communication within and among all of your departments and do not be afraid to share the challenges that face each department. Provide the necessary education and resources to your employees to ensure that they understand how their actions affect the livelihood of the company and, in turn, their livelihood. An employee who is armed with such information will be more vested in the organization and its values, which ultimately benefits everyone.

Protecting Offshore Wind Farm Towers

By Hugues L. Dedeurwaerder, Coatings Research Institute

Photos courtesy of CoRI unless otherwise noted.

The kinetic energy of wind has become an established and growing source of sustainable power, but wind farms on land have their limitations. Properly planned offshore wind farms offer several advantages over their onshore counterparts. For example, the turbines make no noise and cannot be seen from land; therefore, they can be built bigger without disturbing coastal residents and tourists. This larger size and the fact that there is more wind at sea than onshore means offshore wind farms can generate more energy more efficiently. In this article, we look at a zone of 238 square kilometers (approximately 92 square miles) in the Belgian part of the North Sea, at seven offshore wind farm projects. Options for protecting them against corrosion are explored.

Wind Farm Construction Projects

- C-Power on the Thornton Bank – 54 turbines with a capacity of 325 megawatts (MW)
- Belwind on the Blyth Bank – 111 turbines with a capacity of 330 MW
- Northwind on the Lodewijkbank – 72 turbines with a capacity of 216 MW
- Norther southeast of the Thorntonbank – between 47 and 100 turbines with a capacity of 258 to 470 MW
- Rentel between the Lodewijkbank and the Thorntonbank – between 47 and 78 turbines with a capacity of 289 to 468 MW
- Seastar – 41 turbines with a capacity between 252 and 540 MW
- Mermaid – 75 turbines with a capacity of 450 MW

At completion, Belgium will have in the North Sea between 447 and 531 turbines with a total capacity of between 2,120 and 2,799 MW — roughly equivalent to that of 2.5 nuclear power plants. Offshore wind farms are expected to contribute about 43 percent of the Belgian 2020 targets for renewable energy.

Coating Considerations

With the exception of the rotor blades, the wind turbines and towers are built from steel and are thus prone to corrosion, and coatings are the primary method for protecting this kind of structure against such corrosion. A recent study showed that the painting of a turbine tower in an onshore workshop costs between €15 and €25 per square meter between (\$161 and \$269 per square foot). The repair costs for onshore wind turbine towers are estimated to be five to 10 times more per square meter.

For offshore wind turbines, the refurbishment costs increase dramatically and are estimated at more than €1,000 per square meter (\$12,213 per square foot), or about 40 to 60 times the cost of the initial painting in a workshop. It is thus important to avoid

Photo: creative commons /nhd-info/ CCAttribution 2.0 Generic

having to carry out costly refurbishment onsite.

This can only be achieved by observing good practice in the design of the turbine tower and, when applying the corrosion prevention system, taking the following into account:

- the establishment of accurate specifications or method statements;
- the design of the wind tower and its fabrication (for example, minimizing sharp edges, areas that are difficult to paint and places where seawater can stagnate);
- the rust grade of the steel before surface preparation and painting;
- surface preparation, recognizing that durability of a paint system depends on the degree of cleanliness of the surface,
- the correct choice of paint system;
- the correct application of the different coats in the system, including the qualification of the painters and of the application material, respecting the film thicknesses;
- the temperature and relative humidity conditions during the surface treatment and during the application process;
- the drying conditions (temperature, relative humidity, dew point) of the paints, respecting the overcoat time between the different layers; and
- the quality control during the fabrication of the turbine tower, the surface treatment, and the whole paint application

process (primer, intermediate and top coats).

It is through the control of these parameters that long durability of painted offshore structures can be achieved. Currently, the expected lifetime for an offshore wind turbine is 20 years or more.

Aggressive Climates

The turbine towers installed in the south bight (recess in the coastline) of the North Sea are exposed to severe climate conditions, which include:

- high relative humidity and rain;
- a saline corrosive atmosphere (high chloride concentration);
- high UV radiation;
- immersion/drying cycles in the tidal zone;
- the mechanical action of the waves and of floating objects (threatening to erode the paint);
- the action of living organisms and sometimes frost/thaw cycles, and
- pollution (to a lesser extend).

This natural environment is one of the most aggressive in the world. Moreover, the offshore towers are uninhabited and difficult to access. As a result, inspections are not very frequent, and coating deterioration, left unrepaired, can have dire and expensive consequences.

Under severe atmospheric exposure, unpainted steel can lose up to 100

microns (μm) (4 mils) per year through uniform corrosion. Corrosion in seawater is influenced by the seawater temperature, the concentration of dissolved oxygen (which depends on the water depth), the pH, the salt concentration, the biological activity (fouling) and the seawater velocity. The rate of corrosion depends on the position on the wind turbine tower (for example, above high water, in the splash zone, below low water, near the sea bed or below the sea bed). The highest corrosion rate occurs in the splash zone. In this zone, the uniform corrosion rate of unprotected steel can be as high as $500 \mu\text{m}$ (20 mils) per year. In other words, the method used to protect steel against corrosion will depend on the position on the tower, for example, no corrosion protection, corrosion protection through sacrificial anodes or corrosion protection by paints. In the splash zone, where the corrosion rate is the highest, the total dry film thickness (DFT) of the protective coating needs to be more than $700 \mu\text{m}$ — for example, three layers of 2-K epoxy and one layer of 2-K polyurethane.

Currently, there is an increased demand for rapid-drying systems with less solvent and low DFT — requiring the application of fewer layers — to help decrease costs without lowering the anticorrosive protection property. Many existing products are being phased out due to volatile organic compound (VOC) and other environmental regulations; therefore, coatings manufacturers can no longer rely on the long-term track records of their existing products.

What to Ask

Following are the types of questions the wind farm operator should ask to ensure his offshore structures are properly protected.

1. How does one evaluate the durability of the paint system chosen?
2. What are the key factors for achieving long-term durability?

3. Are there standards available to help make a good decision?
4. How does one achieve high anticorrosive protection by paints on offshore structures?
5. Is there a specific standard testing methodology that is reliable for the specific needs?
6. What, specifically, does one need to know about corrosion test methods in order to make the right decision?

Durability Classifications

The corrosivity of the atmosphere can be evaluated using the ISO 12944-2 standard ("Paints and varnishes — Corrosion protection of steel structures by protective paint systems — Part 2: Classification of environments"). The categories are based on a mass loss of a standardized steel sample. The atmosphere of the North Sea would be classified as C5-M — the highest corrosive category. The immersed part of the offshore tower is classified IM-2. Part 4 of ISO 12944 also describes the type of surface and the surface preparation, and in Part 5, typical paint systems are described as a function of the corrosivity of the atmosphere and the expected durability of the paint system.

- Low (L): from 2 to 5 years
- Mean (M): from 5 to 15 years
- High (H): more than 15 years

The class of durability is not a guarantee; it is just an indication of the expected lifetime of the coating system. For the category C5-M, the standard ISO 12944-5 also indicates that, on grit-blasted steel (Sa $2\frac{1}{2}$, which is similar to SSPC-SP 10/NACE No. 2, "Near White Blast Cleaning"), the application of an epoxy primer at $250 \mu\text{m}$ (10 mils) DFT followed by an epoxy or polyurethane topcoat of $250 \mu\text{m}$ DFT ($500 \mu\text{m}$ or 20 mils DFT for the complete system) will have a "high" durability — expected to last more than 15 years. If the structure is exposed to sunlight, the standard recommends the application of an aliphatic polyurethane rather than an

epoxy topcoat, as epoxies are prone to chalking by UV radiation.

This standard also describes the laboratory performance test methods. For a corrosivity classification of C5-M and a high durability rating, the standard indicates that the paint system applied on blasted steel (Sa $2\frac{1}{2}$) must withstand 720 h humidity testing following ISO 6270, "Determination of resistance to humidity" and 1,440 h neutral salt spray following ISO 9227, "Corrosion tests in artificial atmospheres — Salt spray tests." It should be noted that ISO 12944, which is nearly always used, does not require testing UV resistance and that the humidity and salt spray tests recommended are continuous rather than cyclic tests.

The salt spray test, a method that simulates a single stress factor, is one of the earliest corrosion tests, introduced in 1914 and standardized in 1939 under the reference ASTM B117, "Standard Practice for Operating Salt Spray (Fog) Apparatus." It is now recognized that the results from the continuous salt spray test do not match the corrosion patterns in real life; nevertheless, the neutral salt spray test remains the most commonly used standard method. In truth, no accelerated test can accurately and universally predict performance and service life for all types of protective coatings in all outdoor environments.

Cyclic Tests

The cost of corrosion has been estimated to represent about 3 percent of the gross national product of industrial countries, and these huge costs need to be decreased. For a number of years, there has been a demand for a test procedure that can better mimic reality and predict anticorrosive performance in order to have more control over costs incurred because of corrosion. This has given rise to the cyclic weathering test, designed to match real climate conditions, including the weather variations that a paint system undergoes in the field. The aim is

to better forecast the long-term performance of the paint system.

The first cyclic corrosion test (CCT) shown to be useful was the Prohesion Test, developed by Harrison and Timmins in the U.K. between 1960 and 1970.

More recently, the ISO 20340 standard, "Performance requirements for protective paint systems for offshore and related structures" (first published in 2003 and updated in 2009), was developed based on concepts in ISO 12944 1–8 but recommended cyclic weathering testing instead of continuous weathering testing. In this test, one weathering cycle takes a complete week (168 hours) and includes:

- 72 hours UV exposure combined with condensation, following ISO 11507 rotation of periods of 4 hours UV exposure and 4 hours condensation at $50 \pm 3 \text{ C}$ ($122 \pm 5 \text{ F}$);

- 72 hours salt-spray exposure, following ISO 9227; and
- 24 hours at low temperature $-20 \pm 2 \text{ C}$ ($-4 \pm 3.5 \text{ F}$).

Test panels are submitted to 25 cycles (4,200 hours).

The Norsok standard M-501, developed by the Norwegian petroleum industry, uses a similar test cycle to provide requirements for the selection of coating materials, surface preparation and inspection for protective coatings to be applied during the construction and installation of offshore and associated facilities. It makes reference to the pre-qualification of products to the standard ISO 20340 (and thus to the use of cyclic weathering tests).

It should be pointed out that there are other cyclic weathering tests — for example, in the automotive industry. Despite the move to cyclic weathering

tests, there is still no clear correlation between laboratory tests and what is observed in the field. Just because surface preparation combined with a paint system fulfills the ISO 20340 or Norsok M-501 standard, the corrosion protection of a painted steel structure in a very aggressive environment like the North Sea is not guaranteed. Nevertheless, durable, reliable protection is most likely to be achieved if the applicators follow good painting practices and adhere to the fundamental parameters laid out by the chosen standard, including:

- specifications (performance and prescriptive requirements);
- type of steel to be used;
- rust grade of the steel before blast-cleaning;
- preparation grade after blast-cleaning (one of the most important steps for the long-term durability of a painted surface),

- type and quality of paints to be used;
- preparation of the paints (especially the 2-pack paints);
- paint system (primer, intermediate coats, and topcoat), consistent with where it will be used, for example, offshore, onshore, industrial, countryside;
- method of application (good application using quality equipment and skilled painters is crucial; temperature, relative humidity, dew point and air circulation must be controlled);

Conclusion

A high-quality wind turbine protection package, including surface preparation, choice of the paint system, application of the paint system and quality control during the whole process, is of utmost importance when projecting a lifetime of more than 20 years in a very aggressive environment. Because no single test can be completely accurate when predicting protection life for all types of coatings in all types of service environments, the

in the northern North Sea, but it is important to recognize that all accelerated weather testing changes the natural balance of the factors (heat, light, moisture) and excludes others (pollutants, mildew, ozone). While this testing is becoming more common, it still has the potential to inaccurately reproduce real weathering performances. Coating degradation is usually not linear with time and exposure, thus the most reliable weathering is real-time outdoor weathering on the same substrate, in a climate similar to, or more severe than, the end-use location.

About the Author

Hugues Dedeurwaerder is a NACE-certified coating inspector and holds master's degrees in organic chemistry and oceanology. He has worked as a scientific researcher at the Vrije Universiteit Brussel for 10 years where he acquired a Ph.D. specializing in marine chemistry and in particular, marine aerosols (air-sea interactions). Since 1988 Dedeurwaerder has worked in the research and development department at the Coatings Research Institute (CoRI) studying a variety of topics including the role of adhesion and adherence, inhomogeneities and mechanical properties of organic coatings in the protection against corrosion, and a new weldable zinc-rich prim-

er. Since 2003 he has been head of the technological department of CoRI overseeing technological advices (stim-

ulation of innovation), expert witness and quality control (offshore and onshore). Dedeurwaerder is a board member of various associations and from 2011 until 2014 was president of the Belgian Association of Technicians from the Paint and Allied Industries (ATIPIC). **JPCL**

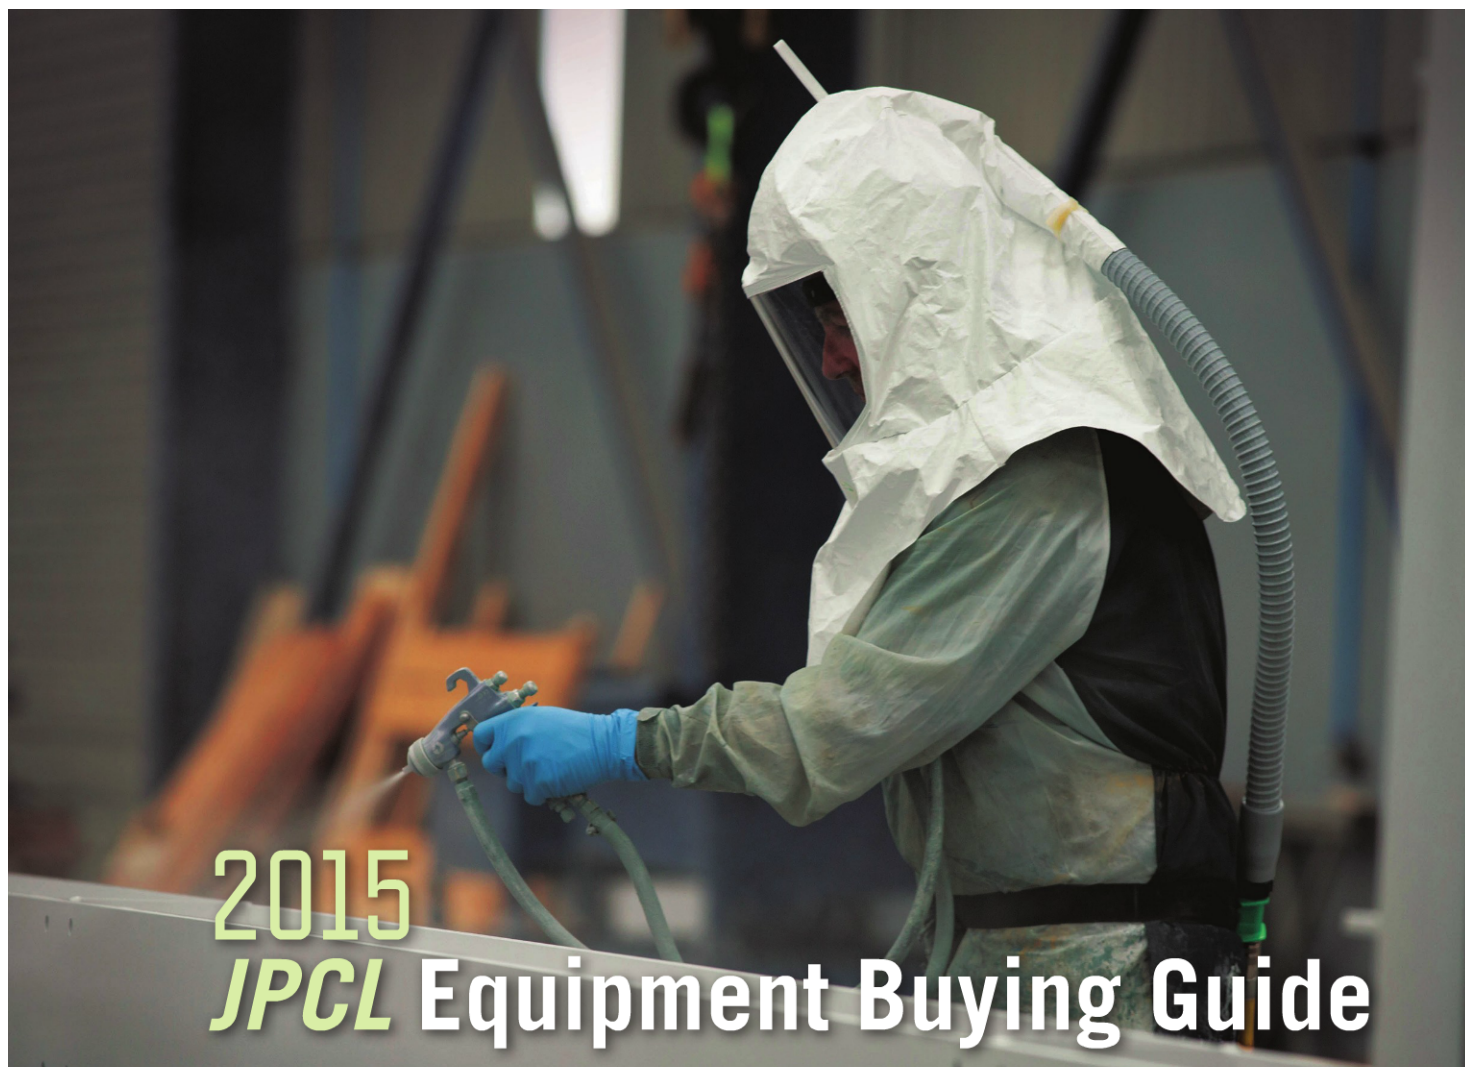

- optimal drying conditions (control of the ambient temperature and relative humidity);
- controlled DFT of each layer (too-thin and too-thick layers are detrimental to the properties of the coating system);
- quality control by a recognized inspector during the whole process (to identify and correct very early errors); and
- environment and climate must be taken into account throughout the project (for example, during wintertime, when high wind speed makes control of offshore wind turbines and reparation work nearly impossible).

offshore wind industry is becoming more accustomed to accelerated CCT as a method for evaluating the anticorrosion properties of protective coatings. The requirements for the CCT are:

- to produce results in a relatively short time (relative to other testing methods);
- to produce results that correlate with outdoor exposures (which differ all over the world);
- to be valid for a wide range of materials and conditions; and
- to be reproducible.

Good correlation has been found between accelerated CCT and field testing

2015 *JPCL* Equipment Buying Guide

Photo courtesy of RPB Safety LLC.

The *JPCL* Equipment Buying Guide lists equipment and related supplies for protective and marine coating work from almost 500 manufacturers, distributors and rental companies, published annually to assist our readers in the identification of equipment and supplies for protective and marine coating operations.

On the following page, you will find the Table of Contents, where generic products are listed under nine categories: Access; Application; Climate Control; Environmental Protection; Inspection; Laboratory Testing; Safety; Software; and Surface Preparation.

On p. 33, you will find the Index to the Buying Guide, where products are displayed alphabetically in a single list. Individual company profiles with contact information can be accessed on p. 127.

In the Guide itself, which begins on p. 35, companies either displayed in boldface type or accompanied by boxed display ads

have paid an advertising fee. Otherwise, a company's information appears free of charge.

The Guide is based on data obtained through a survey sent in April 2015 to companies known to *JPCL*. The print edition of the *JPCL* Guide includes the companies that completed the survey by the deadline for the June 2015 issue. This Guide is also available at www.paintsquare.com/bg, the online home of *JPCL*, where information is updatable throughout the year. To participate in the online edition of the Equipment Buying Guide between print editions, please contact Mark Davis, Directory Manager, at mdavis@paintsquare.com.

Products listed in the *JPCL* Equipment Buying Guide are in no way endorsed by *JPCL*, *PaintSquare*, or Technology Publishing Company.

Take comfort in working with a company you can trust.

Empire Scaffold is a full-service scaffold company providing specialized, on-site support for the life of the project. Since 2001, we've supported projects ranging from small, two-man jobs to turnarounds requiring hundreds of people. We have the products and experience to keep your projects up and running, safely. Call your nearest location and speak to a scaffold specialist today.

DOOSAN Portable Air Compressors.....
Committed to your Productivity & Reliability.
 P185cfm@100psi to
 HP1600cfm@150psi

As the worlds leading manufacturer of portable compressors, Doosan Portable Power continues to surpass competition with more Tier 4i engine emissions compliant air compressors.

**T4 Compliant**

The G70WCU mobile generator delivers 77kVA /62 kW, using a fuel-efficient Tier 4i-compliant Cummins engine, for a 38-hour runtime at 100% load. An innovative cooling system maximizes productivity and fuel efficiency, and airflow management routes engine heat without compromising sound attenuation, for a sound level of just 66dBA.

REAL SOLUTIONS PEOPLE INNOVATIONS

POLYUREA

We provide our clients with the largest portfolio of polyurea coating options on the market.

MARKETS SERVED

SPI's product applications span markets in almost every sector - from Infrastructure to Energy, Environment, and Manufacturing/Engineering.

TRAINING

Over the past couple of decades SPI has conducted over 100 classes and trained more than 2,000 industry professionals.

POLYURETHANE FOAM

For over 40 years we have offered the highest quality polyurethane foam products and systems.

EQUIPMENT

SPI stocks a complete line of GRACO® and PMC, proportioners and parts. SPI also offers our own line of equipment and proportioners.

CUSTOMER SERVICE & TECH SUPPORT

SPI proudly offers 24/7/365 technical support for your project needs, from Polyurea/SPF product application to troubleshooting equipment.

Check out the digital edition of
the buying guide at paintsquare.com/bg

Missed the deadline for this year's print edition of the *JPCL* Equipment Buying Guide? Don't worry — you can still participate in the online Equipment Buying Guide, updated throughout the year and published at www.paintsquare.com, the online home of *JPCL*. To ensure that your company's information is listed in the online Guide, contact Mark Davis, *JPCL* Directory Manager, at mdavis@paintsquare.com.

Stay tuned for *JPCL*'s 2016 Coating Systems Buying Guide, coming this October and listing high-performance coating systems from hundreds of manufacturers, formulated specifically for steel and concrete substrates across a variety of industries.

For more information about *JPCL*'s online Buying Guides, visit www.paintsquare.com/bg.

BE A PART OF THE PAINTSQUARE COMMUNITY.

Save green \$\$\$

Take me to your leader!

The Sidewinder Model M2 Solvent Recycler

- UL listed
- Approved for non-hazardous locations
- Produces crystal clean solvent that can be used over and over again for pennies
- Reduces disposal costs
- Single push button operation
- Self monitoring w/ auto shutoff
- Safety fail-safes
- Made in USA

Sidewinder can save you thousands of dollars a year

Whether you deal with paint, plastics, composites, fiberglass, metal finishing, resin, tire fill, etc.

Take Control!

Combat the rising costs of gunwash, thinners, acetone & more while drastically reducing waste disposal costs.

a **SPY** for every mission

Inspect Any Metal Surface Coating

For pipes, tanks or any coated contoured surface in the field or inside your manufacturing facility, we simplify coating integrity testing with our full line of SPY® portable and permanent Holiday Detectors.

SPY® Model 780, 785 and 790 Portable Holiday Detectors

- New ergonomic design
- Pipe coating inspections up to 60"
- Extremely durable
- Infinite voltage setting on the fly

Compact,
lightweight
wet sponge
holiday
detectors

SPY® Wet Sponge Portable Holiday Detectors

- No belts, lightweight, fast set-up
- Sponge roller speeds large flat surface area inspections
- Interchangeable flat or roller sponge

Reliable continuous inspections
on the assembly line

SPY® In-Plant Holiday Detector Systems

- Custom designed to streamline manufacturing
- From pipecoating inspections to large flat surfaces

For more details on SPY® products and our complete line of SPY® Holiday Detection Equipment visit our website @ www.picltd.com

PosiTest®

Pull-Off Adhesion Tester

Measures adhesion of coatings to metal, wood, concrete and more

**AT-A Automatic**

**Revolutionary
self-alignment feature
and pull rate indicator**

- Electronically controlled hydraulic pump automatically applies smooth and continuous pressure
- Test with the simple push of a button. No twisting, pumping or cranking. No valves to close, needles to reset, or scales to adjust
- User-selectable pull rates ensure compliance with international test methods

**Available in 2 models...
Manual or Automatic**

**AT-M Manual**

CO OUT!

Unique, patented low temperature catalyst purifies compressed breathing air.

- for continuous use to remove carbon monoxide
- no expensive desiccant drying equipment needed
- helps provide comfortable, humidified compressed air to meet Grade-D requirements
- by far, the most economical CO-removal alternative

Don't Just Filter...Purify!

Portable CO removal units from 8 SCFM to 50 SCFM; fixed systems up to 1000 SCFM.

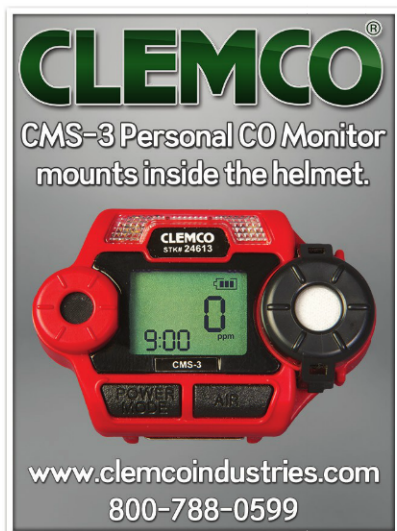

“Save your breath with”

NST®

BARTON

World Class Garnet Abrasives Since 1878

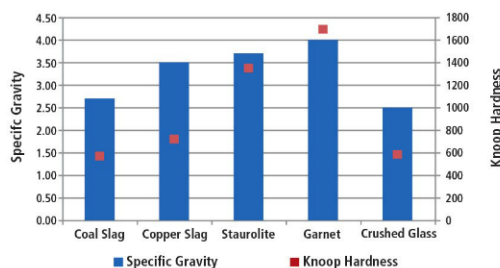

Barton engineered garnet abrasives are 2 to 4 times harder and up to 2 times heavier than ordinary abrasives like crushed glass, coal slag and staurolite. Barton garnet abrasives come in a variety of particle sizes to match your application needs more precisely and work more cost-efficiently.

Get your customers back on line fast with Barton engineered garnet abrasives.

Softer abrasives just don't cut it.

ABRASIVE DENSITY AND HARDNESS

Shorter blast times get your customers' assets back on line sooner, for more completed jobs and higher profits on your bottom line.

To learn more, call 1-800-741-7756 or visit us online at barton.com

U.S. MINERALS

Service. Quality. Value.

With nationwide production and distribution capabilities, U.S. Minerals is capable of supplying a complete range of coal slag and other abrasives to meet all of your blasting requirements.

ADVANTAGES

- Less than 1% free silica
- Approved by California Air Resources Board*
- Passes TCLP (40 CFR 261.24a)
- Approved by U.S. Navy QPL (MIL-A-22262)*
- Chemically inert
- Hard, angular particles
- Very low friability
- Consistently uniform weight and gradation
- Licensed Blastox® Blender

Blastech

More Performance. More Life. More Reliability.

The New Thompson Valve II XL Abrasive Metering Valve Delivers.

A product of Axiom Manufacturing, Inc.

Meet the newest innovation in abrasive metering: the TVII XL™ - Extended Life.

- Engineered for the harshest applications, outperforming even when used with aggressive abrasives such as aluminum oxide and steel grit.
- Up to five times the service life of even the leading TVII for dramatically minimized down time, all while maintaining the Schmidt® standard of precision abrasive metering the Thompson Valve line is renowned for.
- User-friendly improvements make the TVII XL the most advanced, most easily maintained metering valve available.

a new name

For more than 30 years Eurogrit has been part of Sibelco. From this year we are adopting the Sibelco brand and we will now be known as Sibelco Europe.

We will keep the name of Eurogrit as a product brand - and most importantly, our service to you remains as strong as ever. We will continue to meet your needs with the highest quality products, delivered on time and always supported by our technical expertise and customer service.

We offer a complete range of blast cleaning abrasives for surface preparation and minerals for high pressure waterjet cutting:

expendable: Eurogrit coal slag, Euroram copper slag and Green Lightning olivine

recyclable: steel shot, steel grit, aluminium oxide and chilled iron grit

special: Eurofinesse micro coal slag, glassbeads, calcium carbonate, dolomite

We deliver worldwide to meet customers' critical delivery deadlines, supporting all of our products with local technical advice and service.

LESS DUST. LESS MESS.

GE-BLASTER® 1200DT

GeoBlaster® wet abrasive blasters suppress dust and use less abrasive than dry blasters. With less containment and cleanup, you save time and money.

View the GeoBlaster® line at www.geoblaster.com or call 1-888-311-8432 to speak to a sales representative.

NEW COTTONWOOD PLANT

Minerals Research & Recovery, Inc. (MR&R) has been active in the mining, processing and marketing of various mineral products since 1980.

Our products are manufactured under tight quality guidelines at our facilities in Ajo, Arizona and are delivered via a broad distribution network through the southwestern and western United States. MR&R also serves markets in Mexico and in the U.S. Gulf, where it has become a major supplier of abrasives for underwater waterjet cutting, decommissioning and abandonment projects.

Now in 2015, MR&R's sister company, *Minerals Research Inc.* (MRI), is proud to announce the opening of a state-of-the-art plant in Cottonwood, AZ. With its robotic bagging/palletizing system and easy access

to mainline railroads and I-40, the Cottonwood plant is designed and situated to serve you better and faster.

PRODUCT STORY

What sets Sharpshot® apart is the fact that it's the only ambient cooled copper slag sold in the United States today.

Ambient cooling the molten slag creates a much more durable particle that is sub-angular when crushed. There are no highly friable angular particles and slivers in Sharpshot®.

On the job, Sharpshot® is truly a unique blasting abrasive for a number of reasons: productivity, cost effectiveness and recyclability.

In recent tests, our Sharpshot®HP (high performance) has been shown to outperform its competitors. Sharpshot®HP cuts faster with less dust and gets the job done with less material.

Scan the QR (quick response) code to access our website, which contains detailed information about our companies and our products.

Water Jet Solutions

Productivity for sale or rent: HydroPrep® tools

SRT-10 Crawler

Work high with no fall risk; wireless controls

Hand-held VertaJet™

Lightweight, with vacuum recovery

Vortex™

For floors, ship decks and more

NLB's HydroPrep system lets you match tools to your surface prep jobs. Their rotating 40,000 psi water jets get down to bare metal (or concrete) quickly and leave a great surface for recoating.

From manual to fully automated, NLB accessories (and pump units) can make you more productive. You can rent or buy them at any of our six regional branches, or call 800-441-5059.

NLB Pump Unit

Easily converts to 8 pressures, up to 40,000 psi; 1,000 hp max.

The Leader in High-Pressure
Water Jet Technology
