## FEATURES

### 24 PREPARING LEAD PAINT REMOVAL SPECIFICATIONS — WHAT CAN GO WRONG?

*By Daniel A. O'Malley, KTA-Tator, Inc.*

In a series of examples, the author presents written requirements from actual lead paint removal specifications, explains the abundance of errors that can result when language is conflicting, confusing or vague, and recommends alternatives to avoid discrepancies before the work is bid.

### 38 2017 JPCL ANNUAL COATING SYSTEMS BUYING GUIDE

The 2017 JPCL Annual Coating Systems Buying Guide features over 350 coating manufacturers and details about high-performance coating systems suitable for steel and concrete substrates in bridges, chemical and petrochemical plants, food and pharmaceutical plants, marine and offshore structures, railcars, power plants, transmission pipelines, wastewater facilities, water works, and waterfront, locks and dams, as well as specialty function applications. The Guide is published as a resource for facility owners, third-party specifiers, contractors and anyone else engaged in a coatings project and allows the user to identify systems that companies recommend for specific applications, exposures, substrates and specialty functions.

# Concrete Condition Assessments: Why Do Them?

**P**erforming a planned condition assessment prior to installing a coating over concrete will extend the life of the coating system installed and, in turn, extend the structure's service life, minimizing the need for expensive large-scale structural repairs — or possibly even catastrophic failures — of both the coating and the substrate. Neglecting the need for a condition assessment of the existing coating and performing necessary repairs to the underlying concrete beforehand runs the risk of premature failure of the protective coating, which may result in premature deterioration of the underlying concrete. Prior to performing work, it is imperative that you, as the contractor, assess the condition of both the coating and the underlying concrete in order to adequately plan a successful and technically justifiable coating installation.

## Who Should Perform Concrete Condition Assessments?

If you do not have someone qualified in-house, hire a qualified third party to perform the condition assessment — someone who routinely performs coating evaluations, specifically over concrete substrates. This individual should, at minimum, be an SSPC-certified Concrete Coating Inspector (CCI) or an SSPC- or NACE-certified Protective Coatings Specialist (PCS) with experience.

Assessors should demonstrate that they have experience in the following.

- Concrete coating failure analysis.
- Concrete coating selection and application.
- Concrete coating repairs.
- Concrete and concrete coating physical testing.

*Fig. 1: Performing a concrete condition assessment can expose the presence of bugholes, honeycombs or cracking prior to coating application. Photos courtesy of SSPC.*

The person performing the condition assessment should provide a detailed technical report on the condition of the existing coating, as well as the concrete substrate onto which coatings will be installed, enabling the contractor to properly plan the coating installation. The condition assessment report should contain information about the condition of the existing coating, including the condition of the coating film and the existence of potentially hazardous substances. The report should also answer these questions. Does the coating show cracking? Is there blistering? Does the coating show signs of delamination? What coating was previously applied (epoxy, polyurethane, polyurea)? Does the coating contain heavy metals (lead, chromium)?

Also included should be an analysis of any existing coating with an estimation of its remaining life if left unattended, its suitability for overcoating, any technical requirements for overcoating and recommendations for a compatible overcoating system. Recommendations regarding the most cost-effective course of action should be made, for example, no maintenance is needed or complete removal of the existing coating is required. The analysis should also describe what level of surface preparation is needed prior to overcoating, as well as outlining any needed repair work to the existing concrete before overcoating.

The condition of the concrete over which the coatings are to be applied should be assessed. Does the concrete show signs of spalling, cracking, voids or popouts?

## Reduce Risk, Lower Maintenance Costs

No two condition assessments are the same; therefore, the scope of the condition assessment should be tailored to the specific project. It should be recognized that while multiple coating failures or deficiencies may look similar to the untrained eye, the risks of generalizing to save evaluation costs are potentially very high. The cost of a large-scale failure of the coating and complete replacement of the coating system costs far more than a condition assessment for all but the smallest projects.

The risks of repairing a coating system over deteriorated concrete can usually be avoided by designing the project to remove all existing coatings to bare concrete, then implementing appropriate surface preparation and coating application. However, the extra cost of a complete coating removal and replacement may be exorbitant compared to cost of repairing specific deteriorated areas of the concrete substrate followed by application of a maintenance overcoat, especially if much of the existing coating system and the concrete beneath it is found to be in fair-to-good condition. This can only be determined by performing a thorough assessment of both the coating system and the concrete substrate.

It is good practice to consider performing an annual condition assessment to survey all structures to be scheduled for maintenance. Completing this survey at the beginning phases of project planning will provide information necessary for successful budgeting and project design.

The condition assessment can also be a very useful tool for screening structures to determine if maintenance is required. It can be scoped to provide results of a general inspection of many structures to identify those requiring near-term overcoating or recoating. Subsequent, more detailed investigation can then be planned if needed to provide additional information for project planning and design.

## Condition Assessment: Step-By-Step

Once a qualified individual is chosen to perform the condition assessment — whether it is you yourself, someone else in your company or a third party — the following steps should be taken to ensure a comprehensive assessment prior to surface preparation and coating application.

**Step 1:** Gather all relevant information about the structure. Is this an industrial or commercial structure? Is it above or below ground? Is there a vapor barrier? Is there evidence of an existing protective coating or concrete additive? Is there evidence of ground water or infiltration of water? Is there evidence of corrosion? What are the typical ambient conditions of the structure's service environment?

**Step 2:** Complete a visual survey. When examining a structure, visually survey its entire layout. If knowledgeable facility

representatives are available, ask that they accompany you on your preliminary investigation and record information they provide as well as your own observations.

**Step 3:** Divide the structure to be assessed into sections or zones. Draw a diagram depicting the defects and deterioration on the concrete substrate per section or zone.

**Step 4:** Define, per zone, the exterior condition of the concrete or coated concrete. Create a grading system for rating the deterioration per zone. An example of a grading system is shown below.

1. No damage found — no repair is required.
2. Minor damage detected — minor repairs required.
3. Damage detected — critical repairs required.
4. Heavy damage detected — possible structural integrity issues, emergency procedures may be necessary.

**Step 5:** Define, per zone, the interior condition of the concrete or coated concrete.

**Step 6:** Define, per zone, the condition of the protective coating. Ask the following questions while performing this step: What is the condition of the existing penetration sealer? What is the condition of the existing coating? What is the dry film thickness of the coating? What is the adhesion of the coating to the concrete? Is there osmotic blistering of the coating, indicating the presence of moisture? Are there surface imperfections in the coating?

**Step 7:** Conduct a laboratory analysis on a substrate sample when limited project information is available on the concrete matrix or existing coating. The laboratory analysis should consist of the following tests, at a minimum.

- Microscopy: used to determine the number of coats, the thickness of each coat and film imperfections.
- Infrared Spectroscopy: provides information on the identity of organic binders, contaminants and unreacted compounds in the concrete.
- Atomic Absorption Spectroscopy: used to determine the elemental or metal content of coatings.

## Conclusion

Performing a condition assessment of a coated concrete substrate before beginning the project will allow you to develop a thoroughly researched maintenance plan that will improve the performance and extend the lifetime of the coating system and the concrete structure it is protecting. For effective results, a condition assessment must be performed by a qualified individual that conducts the assessment in accordance with a number of detailed best practices for gathering information.

**S**SPC credits are available to participants in the latest free, hour-long presentations in the ongoing 2016 SSPC/JPLC Webinar Education Series.

"Polyaspartic Coatings Technology — Improving Productivity without Sacrificing Performance" will be presented by Todd Williams of Covestro on Monday, October 17. This webinar will focus on polyaspartic technology used in protective coatings applications.

### Registration, CEU Credits

These programs are part of the SSPC/JPLC Webinar Education Series, which provides continuing education for SSPC re-certifications and technology updates on important topics. SSPC is an accredited training provider for the Florida Board of Professional Engineers (FBPE), and Professional Engineers in Florida may submit SSPC Webinar Continuing Education Units to the board. To do so, applicants must download the FBPE CEU form and pass the webinar exam, which costs \$25.

Each webinar will run from 11:00 a.m. to 12:00 noon, EST. Register for these online presentations at [www.paintsquare.com/webinars](http://www.paintsquare.com/webinars).

The basic technology will be reviewed, along with laboratory performance data for both moderate (C3) and heavy-duty corrosive applications (C5), and third-party testing. Lastly, an overview of formulating polyaspartic coatings will be highlighted.

Williams is the manager of the corrosion protection group for Covestro. He graduated with a Ph.D. in polymer science from The University of Southern Mississippi in 2005. After a two-year post-doctoral position researching urethane-based coatings, in 2007, he began working for a startup company synthesizing renewable polyols. In 2009, he joined Bayer MaterialScience (now Covestro), and in 2012 he became manager of the corrosion protection group. Williams is a NACE-certified Level 2 Coating Inspector.

This webinar is sponsored by Covestro.

"Trauma to Transcendence: CUI and Coatings of Choice" will be presented by Dr. Mike O'Donoghue and Vijay Datta, MS, of AkzoNobel/International Paint LLC on Tuesday, October 25. Everyone knows that corrosion under insulation (CUI) is a huge problem and that there is plenty of trauma associated with tackling it. Like a virus, CUI is insidious, not readily observed and thus difficult to detect, and it costs a fortune to deal with CUI effectively. Against this backdrop, join Dr. O'Donoghue and Datta as

## Polyaspartic Coatings, CUI Covered in New Webinars

Todd Williams

Dr. Mike O'Donoghue

Vijay Datta, MS

they explore transcendent coating solutions to combat the dreaded CUI.

O'Donoghue is the director of engineering and technical services for AkzoNobel Coatings Ltd. (Canada). He has a Ph.D. in inorganic chemistry from the University of Surrey, England, and has more than 30 years of experience in the protective coatings industry. JPCL named O'Donoghue as one of the protective coating industry's top 25 leaders and thinkers of the past 25 years. He is the recipient of a Clive H. Hare Honors Award and has been a keynote and plenary speaker at several international conferences.

Datta is the director of protective coatings, North America, for International Paint LLC. He earned a B.S.

degree in chemical engineering from IIT Delhi, India and an M.S. in chemical engineering from New Jersey Institute of Technology. With more than 44 years of experience in the protective coatings industry, Datta holds two U.S. patents and was the recipient of the Cardolite M. T. Harvey award as the first person to commercialize the phenalkamine curing technology for use in marine and protective coatings.

O'Donoghue and Datta have authored over 60 research papers, articles and conference papers for chemical, marine and industrial publications. Six papers have won SSPC's Outstanding Publication Award and five won JPCL Editor Awards.

This webinar is sponsored by AkzoNobel.

## SSPC Issues Two Standard Revisions

**S**SPC, the Society for Protective Coatings, has released editorial revisions to SSPC-PA 2, "Procedure for Determining Conformance to Dry Coating Thickness Requirements," and revisions to the joint SSPC/AWS/NACE standard SSPC-CS 23.00/AWS C2.23/NACE No. 12, "Specification for the Application of Thermal Spray Coatings (Metallizing) of Aluminum, Zinc, and Their Alloys and Composites for the Corrosion Protection of Steel."

SSPC-PA 2 is a tool for property owners and specifiers to use in specifying dry coating thickness, and for

contractors and inspectors to use in determining compliance with specifications. The most recent revision of SSPC-PA 2 was released in January 2015; the new revisions are editorial in nature. Some revisions involve units of measure; another revision deals with SSPC-PA 2 in relation to SSPC-CS 23.00, the new version of which refers to the -PA 2 standard.

SSPC-PA 2 is authored by SSPC committee C.3.2, Measurement of Dry Coating Thickness, under committee chair William D. Corbett of KTA-Tator, Inc.

SSPC-CS-23.00 is a joint standard, issued by SSPC, the

American Welding Society (AWS) and NACE International, designed for use by facility owners and specifiers, inspectors and contractors in applications of thermal spray coatings. Also classified as AWS C2.23 and NACE No. 12, the standard establishes minimum requirements for surface preparation before thermal spray application and applications of sealers or topcoats over thermal spray coatings. The 2016 revision includes a reorganization of the previous 2003 version, as well as the revision of requirements. New appendices also describe optional procedures for verifying adhesion and

thermal spray coating thickness, referring to SSPC-PA 2. Appendices that described or applied to procurement and contract requirements were removed in the new version of the standard.

SSPC-CS-23.00 is authored by SSPC C.1.14, AWS C.2, and NACE TG 146 committees.

These two newly revised standards, along with all other SSPC standards, are available at [www.sspc.org/market-place](http://www.sspc.org/market-place). SSPC members can also access the standards via the SSPC mobile app.

## Dow DuPont Deal Hits Regulatory Snag

The proposed merger of two chemical giants has hit a roadblock as the European Union's antitrust authority halted its review of the transaction, citing missing information.

The European Commission had initiated a Phase II review Aug. 11 to determine whether the proposed merger-of-equals between The Dow Chemical Company and DuPont is in line with the EU Merger Regulation. Just about a month later, the EC announced it was halting its review process because the companies had failed to submit required data, *The Wall Street Journal* reported.

"The commission has stopped the clock in its in-depth investigation into the proposed merger between Dow and DuPont," European Commission spokesman Ricardo Cardoso said. The *Journal* noted that extensions during EU merger reviews are not uncommon.

At the time the deal was announced, the companies forecast completion of the transaction by the second half of 2016, if federal antitrust regulatory commissioners approved the deal. The timeline later shifted to early 2017 when the EC announced a revised review deadline of Jan. 11. Now, with the postponement of the investigation, the review deadline is likely to be pushed back further.

However, Dan Turner, a spokesman for DuPont, referred to the request for information as "a routine procedural part" of the review process, adding, "It does not change our timing expectations." The nature of the missing information was not disclosed.

As reported previously, upon completion of the \$130 billion deal, the companies plan to form a new entity, DowDuPont, that would later split into three separate independent, publicly traded companies focused on material science, agriculture and specialty products. The paints and coatings industry has focused on the side of the deal that will combine the two chemical and coatings titans into "powerful innovation and material science leaders."

The EC's concerns, however, lay on the agricultural side of the business, saying the proposed merger would create the world's largest integrated crop protection and seeds company. Earlier in the year both companies had privately shared proposed concessions to EU authorities to address antitrust concerns, sources said, but the EC responded that the concessions were "insufficient to clearly dismiss its serious doubts." The agency may ask for additional concessions, according to Margrethe Vestager, head of the EC.

The merger is currently undergoing related reviews in the U.S., Canada and Brazil.

### Steamship Restoration Gets Coatings Boost (Sept. 13)

A historic steamship in Scotland is being restored to what it looked like 80 years ago, with the help of a marine coatings manufacturer.

The TS *Queen Mary*, built in 1933, is the last remaining Clyde-built turbine steamer, a class of ships that operated in Scotland in the 19th century Marine Corps and half of the 20th. Clyde steamers, as their name implies, ran on the River Clyde and Firth of Clyde, connecting Glasgow with coastal towns on the Firth.

The 252-foot-long vessel was saved in 2015 by a nonprofit called Friends of TS *Queen Mary* which is working on a €2 million (approximately \$2.6 million) restoration of the ship. It had changed hands several times since its last excursion on the Clyde, in 1977, and had served as a restaurant and bar complex on the Thames in London for two decades, from the 1980s through 2009.

The plan for the *Queen Mary* is to make the ship one of the largest maritime exhibits in the U.K., docking it in Glasgow and using the craft to educate school children and adults alike about the area's maritime history.

AkzoNobel's International marine coatings brand is supplying coatings that are being applied in drydock in Greenock, on the Firth of Clyde, according to the coatings manufacturer.

The nonprofit is still soliciting donations to help with the cost of restoration.

1. NC Bridge Painter Suffers Fatal Fall
2. Chemical Giants Face \$90B Suit
3. Tarp Fire Closes Pittsburgh Bridge
4. Painter Hurt in MD Tower Fall
5. Pipeline Giant Forms in \$28B Deal
6. PA Bridge Bid Spurs Suit
7. More Injection Wells Halted After OK Quake
8. Report Reveals Factors in Bridge 'Split'
9. Repairs, Fines, OSHA Follow Bridge Fire
10. Spectra Lays Blast to Very Fast Corrosion

## WHAT'S GOT US TALKING

**Last month, a painter fell to his death on a water tower job, working for a firm with numerous safety violations and falls in its history. What more can be done to prevent such tragedies?**

*(PaintSquare News Weekly Poll, Sept. 25-30)*

Fines for repeat offenders should be greater, and companies with multiple violations should be monitored more closely to ensure their safety culture changes.

32%

Companies with a number of repeat safety violations should have their licenses revoked; fines are clearly not a deterrent to unsafe practices.

56%

Unfortunately, there's not much we can do; some workers simply don't follow safety rules, and sometimes the consequences are tragic.

12%

**Steve Brunner:** "Disciplinary actions against workers who violate safe work practices go along with corporate fines."

**M. Halliwell:** "I'm starting to think that the U.S. OSHA needs to follow the Alberta example when it comes to worker compliance. If the worker has been trained and 'knows better' then they can be individually fined on the spot by the inspector. It's not a huge fine, but enough to make a dent in the wallet and, hopefully, get the point across."

**Car F.:** "A worker violating the safety rules is a worker either improperly trained or poorly supervised. A poorly trained worker doesn't know what to do. A poorly supervised worker will get away with committing infractions without being subjected to progressive discipline. Both training and supervision require money. Money is something that companies do not want to part with. Best to blame the worker and fire him or her."

# On Accelerating Cure Over an IOZ-Coated Surface

**CAN WATER BE SPRAYED ONTO AN IOZ-COATED SURFACE THAT HAS NOT FULLY CURED DUE TO LOW-HUMIDITY CONDITIONS TO ACCELERATE THE CURE?**

**Per Gabrielsson**  
*Freelance Consultations and Inspections*

Please feel free to spray (fresh) water. If the surface is not wetted (or preferably kept moist/wet), curing will not take place in low-humidity conditions and the item will have to be reblasted and recoated.

**Om Prakash Jat**  
*Tech International Sharjah Hamriah UAE*

Yes, we can use water spray onto an IOZ-sprayed coating in low humidity areas. It will accelerate the curing process. The painted surface must be dry to touch before spraying the water. Perform the MEK rub test to check if it is cured or not.

**Raymond Merrill**  
*Texas Department of Transportation*  
Yes, water can be sprayed onto an IOZ-coated surface to accelerate cure.

**James Prevatt**  
*Asset Preservation Partners*  
Yes, water is used when low-humidity conditions are discovered, but is not a guarantee of complete success. Use the MEK 100 rub test to assure that cure did in fact occur. If it did not, you will detect uncured IOZ shortly after many rubs. If the zinc is not fully cured, start again by full removal.

**Michael Beitzel**  
*Modjeski & Masters Inc.*  
Misting with water is acceptable when humidity is low and is most effective shortly after application when coating is dry to the touch.

**Alfredo Claussen**  
*Instituto Mexicano del Petroleo*  
It depends. If the IOZ has just been sprayed and humidity can be raised by a fine mist of water, that can produce acceptable results. But if the IOZ was sprayed and some time has already passed, the top of the coating layer could be starting to cure (from the residual moisture in the atmosphere) and form a kind of barrier, preventing the moisture from properly diffusing and reaching the complete thickness of the layer, which could in turn prevent achieving the desired and necessary hardness of the primer.

David Lemke  
Team Industries

In climates where shops need to be heated in the winter, the heating of a building will suck the humidity right out of the air to levels where IOZ might not cure at all. We developed a room in which we induce timed mistings of water and heat to create a sauna. Also, when needed, we have hosed the items with fresh water. As stated previously, the IOZ should be dry to touch before you try to accelerate the curing process. Use an MEK rub test to check when the curing is completed.

Andrew Smith  
Akzo Nobel Pty Ltd.

I would like to recommend an article by Gerald Eccleston, "The Effect of Cure Temperature and Humidity on the Properties of Solvent-Borne Zinc Silicate Coatings," (JPCL, January, 1998) which answers this question nicely. Yes, water can be used to accelerate the cure of ethyl silicate coatings in low-humidity conditions; however, in order to be effective, the water must be applied before the film has dried completely. A dried-out film that has not cured properly cannot be resurrected.

# UNSUITABLE SPRAY EQUIPMENT = UNACCEPTABLE RESULTS

BY PETER BOCK, CUI SPECIALIST, CONSULTANT

**T**his installment of "Investigating Failure" is about a second problem encountered on a project discussed in a previous column entitled "When Words Fail: Overlooking Spec Language Produces Poor Results" (JPCL, August, 2016). The main project was an offshore oil production platform to be installed in the South China Sea after final assembly in Indonesia from component and subcomponent units fabricated all over the world. Both problems involved different valves for use in the structure that were supplied by a single global valve manufacturer to be installed on the same offshore structure for the same owner with the same paint spec and supplier, but each resulted in an entirely different failure.

A large valve company that manufactures valves in locations around the world had been selected to supply all of the valves for a new offshore production platform. The valve company claimed that QA/QC procedures were identical at all of its shops worldwide and that valves could be supplied to fabricators from the nearest valve facility without any difference in the quality of the coating system.

Assuring that the same coating system and the same levels of quality for surface preparation and coating application are obtained for components manufactured in nearby or far-away places requires cooperation from the structure owner, their specifier, the selected coating supplier and the far-flung

manufacturers of the components and units to be assembled into a single production structure.

Early on in the new construction of subassemblies of the offshore platform (nothing was in service yet), groups of valves left the valve manufacturer's shops, supposedly after the valve manufacturer shop's QA professional had inspected them and certified in writing that they met the owner's spec.

When the shipments of valves arrived at the sub unit and the unit fabricator's yard, the inspector there checked them before they were incorporated into use.

### ALL APPLICATION METHODS ARE NOT CREATED EQUAL

Quality work in any craft requires tools matched to the size of the project. Jewelers do not work with sledge hammers and highway projects are not done with tablespoons.

The two commonly used methods of spray paint application are airless and conventional. Airless spray atomizes a stream of paint under very high pressure; conventional spray uses lower-pressure air to atomize a stream of paint.

Airless spray is faster and relatively cleaner, with much less overspray produced, but fan width and fluid flow for airless spray are fixed by the tip size used. The only gun controls available with airless application are "on" and "off." With conventional spray and a competent painter, pot pressure, fluid flow, atomization air pressure and fan width can all be adjusted to

produce an ideal spray for the item(s) being coated.

Conventional spray allows much better control of applied wet film thickness on small complex shapes. Airless spray is ideal for large, relatively flat surfaces; conventional spray is slower but much more suited for coating small, convoluted shapes.

Although there is less dry spray beyond the surface being coated with airless application to relatively flat surfaces, on complex surfaces, the coated surface will pick up a splatter effect from the painter repeatedly triggering the airless gun on and off while trying to coat the various facets of a small detailed shape.

There is no difference in the per-gallon (or per-liter) VOC of an unthinned coating whether it is sprayed by conventional or airless spray, there is the same amount of solvent in the coating, regardless of how it is applied. However, the

Fig. 1: Small valves with complex surfaces require conventional spray application for uniform dry film thickness and acceptable appearance. Photos courtesy of the author.

## Avantguard® redefining anti-corrosion

Redefining protection, durability and productivity. Give your assets proven advanced protection from corrosion with Avantguard, our innovative technology based on activated zinc.

- Reduced rust creep.
- Improved mechanical strength.
- Improved crack resistance, even under high DFTs.

Hempadur Avantguard 750 in compliance with Norsok M-501 is faster curing and easy to apply.

Contact us today at [avantguard@hempel.com](mailto:avantguard@hempel.com) to find out more.

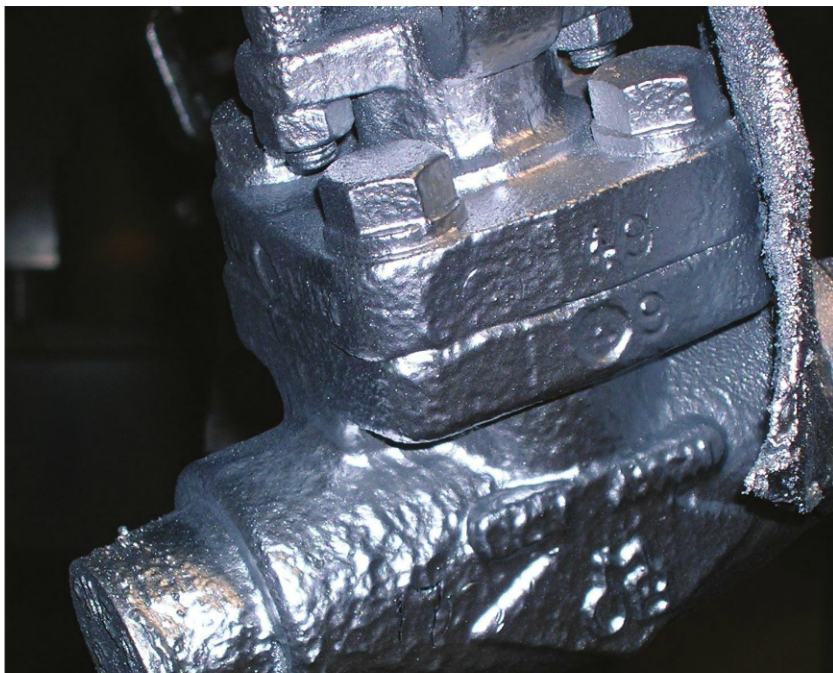

Fig. 2: Stippled, wavy appearance of the coating on a small valve indicates airless spray application and an attempt to control DFT by repeatedly triggering the airless gun.

## Galvastop® - Now Made In The USA!

Galvastop® is an easy to use paint-on masking product for Hot Dip Galvanizing that goes through all pretreatments and comes out of the kettle as an ash that is simply wire brushed off. Unwanted zinc sticks to the Galvastop® and not the steel, allowing you to easily remove both. No grinding or retapping required.

### AVAILABLE IN TWO FORMULATIONS:

**GALVASTOP® RED** • IDEAL FOR FLAT SURFACES  
**GALVASTOP® GOLD** • HIGH-TACK FORMULA IDEAL FOR USE ON  
CURVED PARTS, THREADS AND BLIND HOLES

total emitted VOC of a project involving coating small, complex shapes may actually be less with conventional spray, which allows the spray fan and fluid flow to be adjusted to the size and shape of the piece being coated. With the airless method, the painter will tend to use more paint with the on-and-off triggering and most of that extra paint ends up on the side walls or floor of the paint booth and not on the piece being painted.

Because of the size and complexity of offshore oil production structures, and because of the challenging offshore environments in which they are placed, a new-construction offshore production structure and all of its components almost always receive the specified surface preparation and coating system at onshore fabrication sites, which may be in different parts of the United States or all over the world.

Fabrication shops that have an attached paint facility prefer to use airless spray. Airless has less overspray, it is easier to change paints or clean up after, and because an airless gun has no settings other than changing the spray tips, it is ideal for less-experienced painters. Such a setup was acceptable for the large, relatively flat valves with the two-coat polysiloxane and silicone system specified for this offshore structure, but it should not be recommended for small, complex-shaped valves where the airless system's inherent lack of control tends to prevent a painter from doing a proper job of application.

### IN REALITY ...

SSPC-PA 2, "Procedure for Determining Conformance to Dry Coating Thickness Requirements," could not be used for inspecting and evaluating the newly coated valves. The total square footage available, even on larger valves, was less than is called for in SSPC-PA 2 so a "catch-as-catch-can" system was used with multiple DFT readings being taken on each coated valve on relatively flat areas that could be reached with

Fig. 3 (Top): Rough surface texture and a wide variation of dry film thickness readings on a small valve are the typical result of airless spray application.

Fig. 4 (Bottom): Very smooth coating surface and relatively uniform dry film thicknesses are characteristic of conventional spray application.

an electronic DFT gauge with a corded probe. Areas on smaller valves that could not be reached with a DFT gauge were to be checked visually with a flashlight and inspection mirror. This inspection method had been agreed upon at a pre-bid meeting with the valve supplier and had been approved by the structure owner.

Valves coated for this project began arriving to the fabricators who were building portions of the offshore structure, and on-site coating inspectors were rejecting many of the valves for uneven

or insufficient DFT of the specified coating system.

A first assumption by the field inspectors was that there had been something wrong with the coating materials used, even though inspection reports showed that most larger valves passed inspection while most smaller valves did not. A lab check of the paint manufacturer's retained samples of the two coatings used by the valve shops with failed valves revealed anomalies, and a check of shipping records for the products involved showed that no one other

than the valve manufacturer was having problems with these products.

A review of the inspectors' reports showed widely varying DFTs on the smaller valves, as well as a stippled or "dry-sprayed" surface appearance. A similar review of the valve manufacturer's QA/QC reports showed that all of the

problem valves had been coated using airless spray.

Telephone calls from the paint supplier to coatings managers at the valve manufacturing facilities asking why airless spray was used elicited various answers. Several European shops claimed they had to use airless spray to meet local

government environmental standards and U.S.-based facilities said their paint process was set up for airless or admitted that it was too much trouble to use two types of application equipment.

In a fortunate coincidence discovered during the telephone survey calls, the coating manufacturer's technical service manager found a facility near Houston that had just finished coating a batch of mostly small valves using airless spray "because that's the way we usually do these," even though the facility had conventional spray equipment on hand. There was enough time to inspect the valves before shipping and the shop's QA/QC manager was interested in rechecking the valves to make sure they wouldn't fail inspection after delivery to the assembly site.

Upon arrival at the valve painting facility, the coating manufacturer's technical service manager rechecked the DFT on the recently painted valves. Data sheet and specification DFT was 8-to-11 mils for the two-coat system on the valves. A check of the dry valves, using an electronic DFT gauge with corded probe, showed readings ranging from 4-to-13 mils on a single small valve, with more lows than highs. Visual inspection with a mirror and flashlight showed primer with only a splatter of topcoat on backs of some bolts and on similar hard-to reach areas. Even accessible surfaces were visibly unevenly coated with spatter evident on flat surfaces as well. All of the small valves showed a similar range of DFTs and the same coating defects.

As mentioned, the facility had conventional spray equipment on hand. The conventional spray pressure pot and gun were brought out, assembled and tested on scrap steel with the technical service manager observing. Everything was in working condition.

An additional set of small valves for the same project had been blasted and were coated with the specified primer, using the conventional spray setup and adjusting fan width, fluid-feed and

Select our Reader e-Card at [paintsquare.com/ric](http://paintsquare.com/ric)

atomization pressure as needed. The painter tested adjustments to the spray gun on companion pieces of flat steel sprayed with the new settings and then checked film thickness with a wet mil gauge before painting out the valves.

The wet primer coat on valves coated with conventional spray was visibly smoother than what had been applied with the airless system. DFT checks of the dry primer the next day showed a very uniform 5-to-7 mils DFT (exactly as specified) with only two low spots of 4 mils DFT found on the whole set of primer-coated valves. The dry primer showed a smooth surface very different from the previous batch of airless-coated valves.

#### RESOLUTION

The valves originally coated at this facility using airless spray were reblasted and recoated, using the conventional spray equipment. On the second try, the finished coating system was visually much smoother and DFTs were almost all within the acceptable range.

The field test results were submitted to the valve manufacturer who then passed them on to the various manufacturing facilities. Two European paint shops required detailed explanations to convince them that using conventional spray instead of airless did not increase the VOC of a coating. Going forward, conventional spray was used on most small valves for the rest of the project and the number of valves rejected for failing to meet the paint specification dropped significantly.

#### CONCLUSION

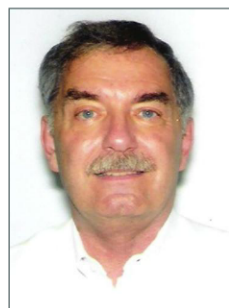

The moral of this story is that one size does not fit all when it comes to spray equipment for industrial coatings. Use an elephant gun if you are hunting elephants, but use something more adjustable and more controllable for hunting small game.

Airless spray is faster, cleaner and easier to handle when coating large, relatively flat surfaces, but is actually a

hindrance when coating small, complex shapes. Conventional spray produces more overspray and requires more work for cleanup or changing coatings, but on small pieces to be coated, the versatility and wider control of conventional spray, when used by a qualified painter, will produce a better job faster, with less paint wastage, lower total emitted VOCs and less required rework than airless spray.

#### ABOUT THE AUTHOR

Peter Bock is a petrochemical coatings consultant and CUI specialist, based in Houston. He is a U.S. Air Force veteran and holds degrees from Tulane

University and the University of Northern Colorado. Bock has 38 years of management, technical service, inspection and sales experience in oilfield

and petrochemical heavy-duty coatings, in the United States, Canada, Mexico, Venezuela, Indonesia and Taiwan. Bock has experience with on- and offshore production, drilling and workover rigs, shipyard work, natural gas and LNG, pipelines, terminals, refineries and chemical plants. He is a recognized expert on carbon steel passivation and corrosion under insulation, and teaches annual courses on corrosion under insulation.

Bock is a past-president of NACE International New Orleans Section and of the Houston Coating Society. He is a NACE-certified Coating Inspector (Level 3), has been published in a variety of industry journals and has presented papers and symposia at the SSPC, PACE, NACE and NAI conferences, as well as at many regional and local coatings and corrosion control events. He is also a JPCL contributing editor and was a JPCL Editor's Award recipient at SSPC 2016 featuring GreenCOAT.

# WHO'S WORKING FOR YOU?

BY ALISON B. Kaelin, CQA, ABKaelin, LLC

**W**hether in the office or the field, the biggest factor affecting every coatings project are the people involved in the planning, implementation and monitoring of the project. Who are these people or companies, how do we determine that they're up to their tasks and what people-related issues are impacting our industry?

## COMPETENCY

Competency is possession of a set of skills or abilities required to perform a task successfully and efficiently. We all expect our employees, consultants, inspectors and contractors to be competent.

There are many ways to determine competency. We frequently rely upon company or individual certifications as a measure of competency to perform certain tasks such as coating inspection or ambient air monitoring but competency can vary greatly. Even the terminology can be confusing. What does it actually mean in practice and who is performing or overseeing your work?

Some of our earliest concepts about the competency of coating inspectors, auditors and overall quality management come from the ANSI standards used for nuclear power plants. ANSI N45.2.6-1978, "Qualifications of Inspection, Examination, and Testing Personnel for Nuclear Power Plants" and its sister standard for quality assurance programs (N45.2)<sup>1</sup> established the basis for ASTM, SSPC and NACE inspector and applicator training programs,

SNT-TC-1A<sup>2</sup>, Certified Welding Inspectors (CWI) and nondestructive testing (NDT) qualification programs. They are also the basis for minimum requirements for quality control or third-party inspection staff under the SSPC-QP1, -QP3 and -QP5 certification programs.

Most of the aforementioned programs establish three different inspector levels with specified job responsibilities and metrics for experience, education, training and qualification. All of these programs presume that the Level-I inspectors are "capable of performing certain tasks" but that they are being supervised by Level-II or Level-III inspectors who have "demonstrated capabilities" in the functions being performed and are directly reviewing the Level-I inspector's work. These standards also presume that annual evaluations of performance and periodic recertification are taking place in order to verify continuing competency.

## EDUCATION, TRAINING AND INDOCTRINATION

Education is concerned with the development of the mind and intellect and is generally measured in levels such as high school or GED, college or post-college. The higher the education level, generally the less experience is required.

Training pertains to learning specific skills or concepts necessary for qualification. It generally includes instruction in standards, concepts, equipment, procedures and documentation.

It can be accomplished in one-on-one, classroom or online formats. It may be formal (provided by a specific organization or qualified person, or be of a specified duration or curriculum) or informal (provided internally with loosely defined requirements). It is generally documented through examinations and/or skill assessments.

Indoctrination is internal to an organization and addresses training the employee in the quality assurance and/or quality control programs, inspection procedures, forms and other company-specific protocols for performing job responsibilities.

## EXPERIENCE

ASTM D4537, "Standard Guide for Establishing Procedures to Qualify and Certify Personnel Performing Coating and Lining Work Inspection in Nuclear Facilities" defines Level I, II and III as indicative of the time in grade classification for personnel who perform coating and lining work inspection. Each level reflects progressive experience and responsibility.

It states that "on-the-job training must be part of the certification program with emphasis on first-hand experience gained through actual performance of inspections and tests." It further classifies experience as being in equivalent inspection activities as those being performed.

A Level I inspector candidate would be expected to have a high-school diploma and six months of experience or a college degree and three months of experience in equivalent inspection activities.

To apply for SSPC Level-2 Basic Coating Inspector (BCI) certification, two years or 3,000 hours of experience is required. NACE Level-1 certification requires a candidate to demonstrate 18 months of experience.

## QUALIFICATION AND CERTIFICATION

Qualification is defined as the skills, training and experience required for personnel to perform properly the duties and execute the responsibilities of the appropriate certification level. ASME NQA-1:1994<sup>3</sup>

expands on this definition as "the characteristics or abilities gained through education, training or experience or both as measured against established requirements such as standards or tests, that qualify an individual to perform a required function." It generally includes hands-on demonstration or skills assessment.

Certification is what a learner achieves when he or she completes prescribed training and passes an assessment with a minimum score by an independent agent. It can also include the act of determining, verifying and attesting in writing to the qualifications of personnel, processes, procedures or items in accordance with specified requirements. Certification in the case of SSPC, NACE or others is written documentation of qualification.

## WHY IS THIS IMPORTANT?

Here's why. If you specify a NACE or SSPC Level-I inspector, or coatings inspection training, you may get someone who's completed approximately three-to-five days of training and passed a written exam but has no minimum level of experience in coating inspection.

Additionally, what counts as experience and who is assessing it? Is working in a paint store equivalent to coating inspection experience? Has the experience been gained under the tutelage of a qualified Level-II or -III inspector?

Are we verifying that our candidate and Level-I inspectors have documented on-the-job training and have received proper indoctrination in the company programs and procedures related to performing coating inspection before working on our job sites?

And these questions don't just relate to coating inspectors. What are the qualifications of your consultants and monitoring firms, or the qualifications of your own staff for that matter? Are they qualified to do what they're doing?

OSHA defines a qualified person as "a person who, by possession of a recognized degree, certificate or professional standing, or who by extensive knowledge,

training and experience, has successfully demonstrated his or her ability to solve or resolve problems related to the subject matter, the work or the project."

And it's not about one extreme or the other — it's matching one's qualifications to the task at hand. Here's a personal example. I'm a degreed civil and environmental engineer with over 30 years of experience with containment design drawings. I'll develop or review containment drawings for SSPC-Guide 6 compliance or ventilation calculations, but I won't do or review structural calculations. Despite my other qualifications, I'm not qualified for that.

Due to our retiring workforce, many people writing and enforcing specifications, reviewing submittals and performing coating inspection or EHS tasks today may not have sufficient training, education, qualification and/or experience "to solve or resolve problems related to the subject matter, the work or the project."

## FATIGUE MANAGEMENT AND FITNESS FOR DUTY

Summer is over but DOTs are still in full swing with construction projects. Orange cones and alternate routes abound; bridge painting is plentiful and workers are taking advantage of every bit of daylight and good weather to get paint on the steel. In the fabrication shops, as workloads increase, shifts are added to continually fabricate and paint steel. Plants of all kinds are undertaking outages to complete critical maintenance and repair operations. Pipelines are being built and painted. The economy is cranking, workers are busy and the overtime is flowing. An average painting crew and coating inspector can work 70-to-80 hours a week, up to 16 hours a day for weeks or months on end. So that's good, right? Maybe not. And how much is too much?

OSHA defines a "normal" work shift to be a work period of no more than eight consecutive hours during the day, five days a week with at least an eight-hour rest. Any shift that incorporates more continuous hours, requires more consecutive

days of work or requires work during the evening are considered to be extended or unusual.

The investigation into the BP Texas City Incident in 2005 by the U.S. Chemical Safety and Hazard Investigation Board (CSB) indicated that an "... extended working period clearly has the potential to contribute to a lack of attentiveness and slowness to identify and respond to process upsets."<sup>4</sup>

A lack of sleep impedes a worker's judgment. Experts contend that when someone has been awake for 21 hours, he or she will perform at a level of impairment roughly the same as a person with a blood alcohol level of 0.08 percent. Just like alcohol or drug use, a lack of sleep increases risky behavior. Research by Margaret Chan in 2011 found that a workplace incident is four times more likely to be caused by fatigue than by alcohol or drug impairment<sup>5</sup>.

Extended or unusual work shifts may be more stressful physically, mentally and emotionally than we realize. Non-traditional shifts and extended work hours can disrupt the body's regular schedule, leading to increased fatigue, stress and lack of concentration. These effects lead to an increased risk of operator error, injuries and/or accidents. Studies suggest that it can take up to 10 days to adapt to a night-time work schedule<sup>6</sup>.

According to a 2010 study by the University of British Columbia, Canadians who worked night and rotating shifts were almost twice as likely to be injured on the job when compared with those working regular day shifts<sup>7</sup>.

Multiple sources list fatigue as one of the top five causal factors in workplace incidents and Vegso et al (2007) found an 88-percent-increased risk of incidents for individuals working more than 64 hours a week<sup>8</sup>.

As employers try to do more work with fewer bodies (especially in cases of projects staffed with a single employee), workers are often forced to work in a state of sleep deprivation and as workers tire, they make more mistakes and riskier choices. So, just

how widespread is the threat? In 2006, the Institute of Medicine (U.S.) Committee on Sleep Medicine and Research reported 50-to-70 million American adults suffer from sleep and wakefulness disorders<sup>9</sup>.

### REGULATIONS AND REQUIREMENTS

Currently, there is not a specific OSHA Standard applying to extended or unusual work shifts. However, OSHA could still fine employers for failing to protect workers from shiftwork-induced fatigue under the General Duty clause, Sec. 5(a)(1) of the Occupational Safety and Health Act, which requires dealing with "recognized hazards" likely to cause death or serious physical harm<sup>10</sup>.

The U.S. Department of Transportation rules limit the number of consecutive and cumulative hours truckers can drive over a given period<sup>11</sup>.

The Pipeline Hazardous Materials Safety Administration (PHMSA) requires pipeline operators to address fatigue management in their planning (including for contractors)<sup>12</sup>. Many also require implementation of fatigue management programs that meet API Standard RP-755 or similar<sup>13</sup>.

API Standard RP-755 was initiated after the 2005 BP Texas City Refinery incident CSB recommendations. It is applicable to anyone covered by the OSHA Process Safety Management Standard 29 CFR 1910.119.

OSHA recommends that managers limit the use of extended shifts and increase the number of days that employees work. Working shifts longer than eight hours will generally result in reduced productivity and alertness. In addition to fatigue, employers must ensure that employees are not exposed to hazardous chemicals or other agents in excess of health standards. Working extended shifts may involve prolonged exposure to hazards which exceed established standards.

OSHA says that managers and supervisors should learn to recognize the signs and symptoms of the harmful health effects of extended and unusual work shifts

and monitor workers. API RP-755 and PHMSA guidelines suggest that managers should plan to avoid worker fatigue and track employee time sheets and work hours to eliminate or reduce extended shifts. Some pipelines require submission of a fatigue management plan for all contractors and subcontractors working on-site.

### CONCLUSION

Take the time to make sure you, your colleagues and your vendors are qualified, competent and working to achieve efficiency and success.

## PREPARING LEAD PAINT REMOVAL SPECIFICATIONS – **WHAT CAN GO WRONG?**

**BY DANIEL A. O'MALLEY, KTA-TATOR, INC.**

*Fig. 1 (Above): In community settings, sound barriers are often specified to provide a buffer between abrasive blast-cleaning equipment and the general public. Photos courtesy of KTA-Tator, Inc.*

**S**pecifications for the removal of paint that contains lead or other toxic metals should establish an owner's expectation for worker protection, environmental compliance, protection of adjacent workers and/or the public, and waste management. A well-written specification will provide clear and concise language for the method(s) of coating removal and corresponding containment and ventilation requirements, establish requirements and acceptance criteria for any visual or instrument monitoring, and define the time frames and content for any project submittals. Poorly prepared lead paint removal specifications can lead to challenges when comparing bids and dealing with construction phase disagreements, costly change orders

and potential litigation. This article presents ten examples of questionably written requirements from actual lead paint removal specifications, discusses resulting problems that may occur and proposes alternate specification language.

### EXAMPLE 1

"Environmental monitoring such as air, water, soil and sediment sampling shall be conducted throughout the project as appropriate to characterize and prevent releases outside of the containment."

This specification requirement doesn't do a very good job of defining the expectations for environmental monitoring on the project. As a contractor trying to bid work governed by this specification, there should be a number of red flags raised as a result of this very generic, blanket statement. First and foremost, this statement forces the contractor to read the mind of the specifier — a dangerous proposition. And from a specifier's standpoint, this statement leaves the environmental monitoring entirely at the discretion of the contractor without setting any guidelines or parameters. Questions left unanswered by this statement include the following, at a minimum.

What type of air monitoring is the specifier requiring? Is regulated area air monitoring to be conducted using personal sampling pumps? Or is the specifier more concerned with the quality of the air beyond the regulated area (high-volume ambient air monitoring), and if so, are they interested in total suspended particulates (TSP) and/or respirable particulate matter (PM-10)? These are very different types of air monitoring, with different data outcomes, different purposes and vastly different costs.

Regarding soil sampling, how many samples is the specifier requesting be collected? Will the number and location of samples be selected in accordance with SSPC-TU 7, "Conducting Ambient Air, Soil and Water Sampling During Surface Preparation and Paint Disturbance Activities"? And are samples to be collected only in areas where hazardous waste is anticipated to be stored and/or beneath the paint removal equipment in the lay-down area or elsewhere?

What acceptance criteria will be used for the air monitoring and soil sampling? If ambient air monitoring is conducted, will the results be compared to the National Ambient Air

At what frequency should air monitoring be performed — initially (during the first 5 days of blast-cleaning), daily, periodically?

For what metals will air and soil samples be analyzed? Is the concern only for the presence of lead or should consideration be given to analysis for any additional toxic metals that may be present in the coating being removed or in the abrasive being used?

The specifier in this scenario would have made the bids more responsive and the project a lot simpler for the resident engineer and the contractor had the type of monitoring, frequency of monitoring, acceptance criteria and analytical parameters been defined up front in the specification.

Fig. 2: Specifications should establish project-specific hazardous and non-hazardous waste storage area requirements.

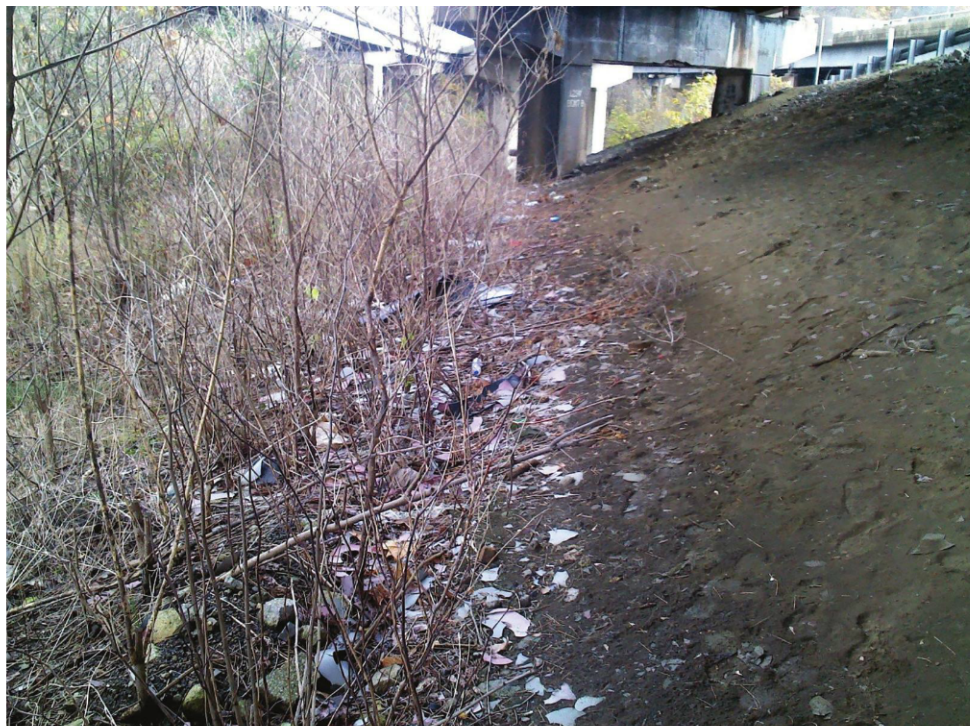

Quality Standards (NAAQS) criteria for TSP-lead or some other local acceptance standard? Will there be an allowance to convert the acceptance criteria to daily and adjusted daily allowable concentrations as described in SSPC-TU 7? Will soil sampling results be compared to an established standard or will pre-project geometric means be compared to post-project geometric means in order to determine whether paint removal operations contributed to the existing soil conditions?

### EXAMPLE 2

"Visible emissions shall be determined in accordance with SSPC-Guide 6 (Latest Edition), Section 5.5.1, Method A. Visible emissions shall not exceed Level 1, which limits emissions to a cumulative duration of no more than one (1) percent of the workday."

There are two different sets of concerns related to the specification requirements described in Example 2. First, the opening sentence indicates that visible emission assessments shall be conducted in accordance with the latest version of SSPC-Guide 6, "Guide for Containing Debris Generated During Paint Removal Operations," Section 5.5.1, Method A. Were the reader to review the latest version of SSPC-Guide 6 (May 2015), he or she would find that Section 5.5.1 refers to Section 6 of SSPC-TU 7. This document, while the

*Fig. 3: Specifications should establish guidelines for how pre-existing paint chips will be handled and what affect the paint chips will have on pre-project and post-project soil sampling.*

appropriate reference, was not included in the References section of the specification. Additionally, when referring to Section 6 of SSPC-TU 7, the reader would find himself or herself reading a description of guidelines for Area or Perimeter Air Monitoring, while the section of SSPC-TU 7 related to conducting visible emission evaluations is actually included in Section 8. The specifier should always verify that all of the references included are not only current, but relevant to the work, and that the appropriate sections are being referenced. The other alternative is simply not to reference a particular section.

The second sentence defines the acceptance criteria that will be used to evaluate whether visible emissions are acceptable for this project. However, the statement omits a fairly important piece of information — at what frequency should the assessments be performed? Imagine the potential conflicts if the frequency of visible emission assessments remains undefined. The contractor may indicate that he or

she intends to do one 15-minute assessment for the entire work shift, yet emissions are occurring from containment throughout the day and occupants of neighboring private residences are filing complaints that their children are being exposed to harmful dust. If the specification had indicated that 15-minute assessments were to be performed once an hour during dust-producing operations, modifications could have been made to the containment system to limit the emissions and the complaints, and potential lawsuits may be avoided.

The specifier must verify that all references are current and applicable to avoid any confusion. Likewise, the level of detail when specifying environmental monitoring should always include the frequency of assessment. In this particular scenario a single sentence could have been added indicating that visible emission assessments are to be performed at least four times per day.

### EXAMPLE 3

"A report of waste accumulation shall be generated on a weekly basis for each location giving total volumes of waste accumulated. The quantity of hazardous and non-hazardous waste materials generated and stored each work day shall be reported to and approved by the Engineer. The daily log shall be maintained by the Contractor and made available to the Engineer upon request."

These references were pulled from the same specification. In fact, they are from the same section within the same specification. Do you notice anything out of alignment? Regarding reporting requirements — should the quantity of waste generated be documented daily or weekly? The statements presented in this example shouldn't cause anyone too much distress in the field, but they serve as a real-world example of how contradictory requirements can make their way into a specification. This example also amplifies the importance of a thorough

review of the draft specification, especially sections containing information related to like topics, prior to finalization and inclusion into the bid package.

Another example of contradictory language is provided in Example 4 below, with additional and potentially more severe consequences than those presented in Example 3.

#### EXAMPLE 4

"The Contractor shall provide environmental protection such that zero visible dust, as determined by the Engineer, is evident when cleaning and painting operations are performed."

"Unacceptable emissions shall be cause for project shutdown until corrections to the containment are made. Visible emissions shall be determined in accordance with 40 CFR 60, Method 9, and shall not exceed one minute."

As in Example 3, both of these statements are from the same section of the same specification. However, in this example the consequences could be more severe. There are actually two, and potentially three, separate issues at play here.

First, we have contradictory requirements regarding the acceptance criteria for visible emissions. Are no visible emissions allowed or are emissions of up to one minute acceptable? Obviously this is a huge difference and could have an impact on the project schedule as a result of downtime to make repairs to the containment or ventilation systems.

The second issue, based on the assumption that the second statement above is correct and visible emissions are allowed, relates to emissions not exceeding one minute. The specification has not defined the time frame over which the one minute of emissions is allowed. Is it one minute per hour? One minute per day? And the frequency of the assessments has not been defined — once per hour, four times per day? Again, the impact could be significant.

The third issue relates to who is actually responsible for conducting the

visible emission assessments. The first statement appears to place the responsibility on the Engineer while the second statement avoids defining the responsibility entirely. This may be cause for concern on several fronts.

The specification requires that emissions be evaluated using EPA Method 9 which necessitates that the

observer attend a licensed training course to become certified to perform the assessments using the opacity method. This training is very challenging to successfully complete. Will the Engineer have field staff members that hold this certification? If not, what is the timeline for attending and completing the training?

# PosiTector® 6000

## Coating Thickness Gages

### Simple. Durable. Accurate.

- No calibration adjustment required for most applications – measure right out of the box!
- Tough probes, robust housing and strong two year warranty on gage body and probe
- All models include memory, USB port, HiLo alarm, fast measurement mode and Certificate of Calibration
- Includes PosiSoft suite of software for viewing and reporting data
- Advanced models connect to iOS or Android smart devices

**1-800-448-3835**  
**www.defelsko.com**

**Award Winning Compatibility!**  
The PosiTector gage accepts ALL coating thickness (6000/200), surface profile (SPG/RTR), environmental (DPM), ultrasonic wall thickness (UTG) and Shore hardness (SHD) probes.

## FREE WEBINAR

### Polyaspartic Coatings Technology - Improving Productivity without Sacrificing Performance

**OCTOBER 17, 2016**

**11:00 AM - 12:00 PM EASTERN**

**REGISTER NOW AT**

**PAINTSQUARE.COM/WEBINARS**

This webinar focuses on polyaspartic technology used in protective coatings applications. The technology basics will be reviewed, along with laboratory performance data for both moderate (C3) and heavy-duty corrosive applications (C5), and third party testing. Lastly, an overview of formulating polyaspartic coatings will be highlighted. Participants will be eligible to receive credit from SSPC.

## Preparing Lead Paint Removal Specifications

If the Engineer has the responsibility to perform the emission assessments, it will require that the project be staffed almost continuously, or at the very least during dust-producing activities. Does the Engineer have field staff with availability to accommodate this assignment? Oftentimes, field engineers have many responsibilities on a project and firms can rarely dedicate staff to a single assignment.

A better approach would be to have the Contractor perform the required daily visible emission assessments in a quality control capacity, with the Engineer providing quality assurance (i.e., verify that emissions monitoring is being performed by a certified individual and that it is being performed according to the governing method). Also, consistent requirements for the level of allowable visible emissions should be included.

#### EXAMPLE 5

"A Noise Reduction Plan shall be prepared by a qualified Technical Representative of the sound wall material supplier. Noise monitoring measurements shall be taken by trained, qualified personnel."

These two sentences seem straightforward, right? Not so. Because the qualifications of the Technical Representative and the personnel conducting the actual noise monitoring are undefined, the Contractor is left to use his or her own judgement as to what the specifier means by a "qualified" technician, which may lead to a misinterpretation of what the specifier had envisioned. As with the other examples presented, this ambiguity can lead to costly change orders. Envision a scenario where a Contractor provides what they believe to be a "qualified" noise monitoring technician and this individual conducts noise monitoring on the project for the specified period of time. The Owner has never approved this individual (another set of issues entirely) and so now all of the data collected by this technician may be called into

question or deemed invalid. In this scenario, costs to the Contractor might include additional training on how to perform noise sampling or the hiring of a third-party firm to conduct the sampling. In this scenario, where does the Owner stand if there are public complaints lodged related to community noise exposures and the only data on hand is that collected by an unqualified technician? Each of these issues could have been avoided if the specification defined what was meant by a "qualified" technician.

#### EXAMPLE 6

"Conduct background ambient air monitoring daily for a period of three days prior to blasting."

Here is another seemingly straightforward specification requirement except that the number of locations wasn't defined. For the sake of argument, let's say that the specifier indicated (using an addendum) that background monitoring was to be conducted at three locations for a period of three days. This addendum appears to tighten the requirement. Now read the requirement again. How many different locations and for how many days is the specifier expecting background ambient air monitoring to be conducted in this scenario? Is the specification requiring one day of background monitoring at three different locations? Or maybe it's requiring three days of background sampling at three different locations? This misinterpretation could have been avoided if the specification language had been a little more descriptive.

Here's how the scenario actually played out during the project. The Owner expected that the Contractor would conduct three days of background monitoring at three different locations. The Contractor interpreted the requirement to be one day of background monitoring at three different locations. The Contractor's argument was that they did three days of background monitoring, and at three different locations. They assumed that they

had met the requirements of the specification and refused to perform any additional background monitoring. The Owner ultimately contracted with a third party to perform the additional two days of monitoring at each location.

## EXAMPLE 7

"The Contractor shall thoroughly vacuum, wash or otherwise decontaminate reusable items prior to removal from the project site. If adequate cleaning is not possible, the materials shall be treated as waste and tested and disposed of properly."

In this example, what will the criteria be for determining whether or not the materials have been adequately cleaned? Will a simple visual observation for evidence of visible dust be adequate? If so, who will conduct the visual observation? Or maybe dust wipe sampling of horizontal surfaces is the best approach and if so, what acceptance criteria will be used? As written, the word "adequate" has the potential to become a source of dispute, as it is relative.

## EXAMPLE 8

"Submit a written containment system design plan which clearly describes the proposed containment system applicable to the intended removal method and in accordance with SSPC-Guide 6."

While the requirement makes reference to SSPC-Guide 6, it doesn't specify the classification of containment, instead leaving that responsibility entirely up to the Contractor. There's nothing inherently wrong with this approach, but it makes comparing the costs of containment system installation and maintenance quite challenging when evaluating bids. For example, Contractor A may have proposed an SSPC Class 1A containment system with rigid materials and a flexible support structure while Contractor B chose to propose an SSPC Class 3A containment system. Without having to account for negative pressure and air movement within containment, the Class 3A will undoubtedly have a

much lower price tag than the Class 1A containment proposed by Contractor A. However, with open seams and lack of a ventilation system, the Class 3A containment will likely result in a much higher level of emissions which could lead to a high exceedance of ambient air and visible emission acceptance criteria, and ultimately to a greater number of project shutdowns to make corrective actions.

A better approach in this situation would be to specify the level of containment so that the decision of which classification system is not left to the Contractor and a more direct comparison of containment installation and maintenance costs can be made.

## EXAMPLE 9

"Laboratory analyses for all waste stream and environmental samples shall

be conducted by an EPA-certified, independent laboratory with an approved Quality Assurance Plan. Laboratory analyses for worker monitoring and regulated area samples shall be conducted by an American Industrial Hygiene Association metals-accredited laboratory."

In the first sentence, the specification indicates that the laboratory must be EPA-certified and have an approved quality assurance plan. There are two sources of dispute in this statement. First, to the best of the author's knowledge, the EPA only certifies laboratories for analysis of drinking water. The most common accreditations for laboratories performing analysis of environmental or waste samples are the Environmental Laboratory Accreditation Program (ELAP), the National Voluntary Laboratory

# Trauma to Transcendence: CUI and Coatings of Choice

**OCTOBER 25, 2016**

**11:00 AM - 12:00 PM EASTERN**

**REGISTER NOW AT**

**[PAINTSQUARE.COM/WEBINARS](http://PAINTSQUARE.COM/WEBINARS)**

Everyone knows that corrosion under insulation (CUI) is a huge problem and that there is plenty of trauma associated with tackling it. Like a virus, CUI is insidious, not readily observed and thus difficult to detect, and it costs a fortune to deal with CUI effectively. Against this backdrop, join Dr. Mike O'Donoghue and Vijay Datta, MS as they explore transcendent coating solutions to combat the dreaded CUI.

## Preparing Lead Paint Removal Specifications

Accreditation Program (NVLAP) and the National Environmental Laboratory Accreditation Conference (NELAC) — none of which are administered by the EPA. Additionally, there are a number of states that have their own laboratory accreditation programs. Is it the intent of the specifier to have the environmental samples analyzed by a state-accredited laboratory?

The second potential area of dispute is the requirement of using a laboratory that has an approved quality assurance plan. There are agencies including the International Organization for Standardization (ISO) and the American Association for Laboratory Accreditation (A2LA) that audit quality assurance plans as part of laboratory accreditation. Which agency is the specifier requiring? In order to maintain ELAP, NVLAP or NELAC accreditations, the laboratory must maintain a quality assurance plan that meets the requirements of the accrediting agency. In this example, the best approach would be to simply specify the required laboratory accreditation — if the laboratory has this accreditation then it already has an acceptable quality assurance plan.

The highlighted reference was pulled from a specification section titled "Waste Handling and Management." The second sentence includes laboratory accreditation information related to the analysis of worker monitoring and regulated area air samples. When someone is looking for the qualifications of the laboratory responsible for analyzing air samples, the last place that they would consider looking is in a specification section titled "Waste Handling and Management." Misplaced or hidden requirements such as this can lead to costly disagreements or in this particular example, call into question the laboratory results. It is always good practice to review the specification from a big-picture perspective. In this example, the language related to the qualifications of the

laboratory would have been better located in the section of the specification related to qualifications.

### EXAMPLE 10

"If the project activities increase the heavy metal content in soil to more than 20 percent above the pre-job geometric mean or 100 percent at any one location, return the site to the pre-job levels."

Depending on your interpretation, this statement in the specification may require small-scale cleanup at any one location or it may result in full-scale site remediation. For example, let's say that six pre-project soil samples were collected and that five of the six post-project sample results indicated slightly elevated levels above pre-project concentrations, but not greater than 20 percent. One of the six post-project sample results indicated a more significant elevation in the level of contamination over the pre-project concentration causing the post-project geometric mean to exceed the pre-project geometric mean by more than 20 percent. Does this mean that the Contractor has to return the site to pre-project levels at all six locations or just the one location where the elevated concentration occurred? Similarly, if one of the six samples indicated a 100-percent increase over pre-project concentrations, is cleanup of the entire site required or just the one location?

Another issue in play here is that two different means of evaluating sample results are being utilized. When comparing post-project results to the 20-percent-exceedance criterion, the geometric mean for all the samples is calculated. But when comparing post-project results to the 100-percent-increase criterion, it is assumed that a strict comparison between the pre-project and post-project results is being performed on a location-by-location basis and a comparison of geometric means is not being made.

## CONCLUSION

There is no license, certification or other prerequisite for preparing lead paint removal specifications. And the objective of SSPC's Supervisor/Competent Person Training for Deleading of Industrial Structures (C3) course is to train supervisors on how to manage the lead hazard on a project, including worker and environmental protection, and waste management. That is, it focuses on interpreting project specifications, not preparing them. Preparing specifications and associated contract documents is not a simple task and it takes years of practice to become proficient. Each of the examples presented in this article illustrates the need for clearly defined, concise, non-contradictory specification language. When the language is hidden or misplaced, vague, open to differences in interpretation or contradictory, the

associated consequences can cause project delays, costly change orders, and invalid, meaningless data or results. When preparing specifications or special technical provisions for a project, put aside any "pride of authorship" and have one of more reviewers challenge the documents while they are in draft form. It is better that they discover discrepancies before the work is bid, rather someone else discovering them afterwards.

## ABOUT THE AUTHOR

Dan O'Malley is the manager of the environmental, health and safety (EH&S) department and the client advocate for the professional services business unit of KTA-Tator, Inc., where he has been employed for over 21 years. In his position as EH&S department manager, he reviews and develops safety and health programs, assists contractors in

obtaining SSPC certification, develops specifications for removal of coatings containing lead, reviews contractor submittal packages,

performs ambient air monitoring activities and consults on industrial hygiene and safety issues. In his role as client advocate, O'Malley serves as KTA's liaison throughout the client lifecycle ensuring an exceptional client experience. He is an SSPC C3 Supervisor/Competent Person for industrial deleading projects and is also a licensed primary instructor for the C3 and the C5 refresher courses. O'Malley holds a Bachelor of Science degree from the Pennsylvania State University. **JPCL**

JAN 30 - FEB 2, 2017 • TAMPA, FL  
**SSPC 2017**  
 featuring **GRNCOAT**

# SSPC 2017 IN TAMPA:

## TRAINING & CERTIFICATION

A full lineup of SSPC training and certification courses will be offered during SSPC 2017 featuring GreenCOAT, which will be held Jan. 30 to Feb. 2, 2017, at the Tampa Convention Center in Tampa, Fla. The following pages will preview the scheduled training and certification courses, some of which extend before or after the scheduled conference dates. Some courses have prerequisites, which can be found at [www.sspc.org/training/training-home](http://www.sspc.org/training/training-home).

Registration for all SSPC courses must be done separately from the SSPC 2017 conference registration. To register, email or fax a completed training registration form to Nicole Lourette, SSPC member services fulfillment coordinator, at [lourette@sspc.org](mailto:lourette@sspc.org) or 412-281-2331, ext. 2204.

All information is current as of press time. For updates, visit [www.sspc2017.com](http://www.sspc2017.com).

### FLOOR COATING BASICS (C10)

**JAN. 26-27**

This course is designed to meet the practical training requirements of SSPC-QP

8 Section 4.4, which require that each job crew chief and each QC manager complete a minimum two-day overview of concrete components, coating and surfacing types, and surface preparation and substrate repair techniques based on SSPC consensus standard TU 10, "Procedures for Applying Thick Film Coatings and Surfacing Over Concrete Floors." C10 can be taken in place of the first two days of the Concrete Coating Inspector (CCI) program.

### CONCRETE COATING INSPECTOR PROGRAM (CCI)

**JAN. 26-27 (CCB);**

**JAN. 26-30 (TECH. LEVEL);**

**JAN. 26-31 (CERT. LEVEL)**

The CCI program provides several different paths to certification, depending on the attendee's current level of experience; these can be found on SSPC's website. Concrete Coating Basics (CCB) provides basic training and is a prerequisite for individuals seeking CCI certification. The objective of the CCI program is to thoroughly train individuals in the inspection

of surface preparation and the installation of protective coatings on industrial concrete structures and facilities.

### NAVSEA BASIC PAINT INSPECTOR (NBPI)

**JAN. 26-30**

NBPI is an inspection course developed by Naval Sea Systems Command (NAVSEA) to train coatings inspectors to inspect critical coated areas as defined by U.S. Navy policy documents. These areas include (but are not limited to): cofferdams, decks for aviation and UNREP, chain lockers, underwater hull, bilges, tanks, voids, well deck overheads and others. This course is especially valuable, as it also provides the technical and practical fundamentals for coating inspection work for any steel structure projects other than ships.

### BRIDGE COATINGS INSPECTOR PROGRAM (BCI)

**JAN. 26-30 (LEVEL 1);**

**JAN. 26-31 (LEVEL 2)**

The BCI program covers the fundamentals of how to inspect surface preparation

and application of protective coatings on bridge steel. The course covers situations that affect inspection in the field (e.g. containment, field safety hazards, changing weather conditions), as well as the skills required to inspect new bridge steel painted in the shop, in the field or maintenance systems applied in the field.

#### PROTECTIVE COATINGS INSPECTOR PROGRAM (PCI)

**JAN. 26-30 (LEVEL 1);**

**JAN. 26-31 (LEVEL 2);**

**FEB. 1 (LEVEL 3 EXAM)**

The objective of this program is to thoroughly train individuals in the proper methods of inspecting surface preparation and installation of industrial and marine protective coatings and lining systems on an array of industrial structures and facilities. Candidates should be prepared for an intense and fast-paced week of training with evening homework and study.

PCI Level 1 has no prerequisites, but it is not an entry-level course. C1 is strongly recommended as a prerequisite for the PCI program. Students who pass the Level 1 exam and meet the prerequisites for Level 2 can take the written and hands-on Level 2 certification exams on day six. A passing grade on both exams is required to become a Level 2-certified inspector. PCI Level 3 identifies and awards recognition to individuals who have in-depth knowledge in the inspection of industrial coatings. Those who pass the Level 2 exam and meet the pre-requisites for Level 3 can take the Level 3 exam on day seven.

#### FUNDAMENTALS OF PROTECTIVE COATINGS (C1)

**JAN. 27-31**

The C1 course provides an overview for those who are new to the protective coatings industry. It is also an ideal refresher for reviewing the fundamentals of corrosion and the use of coatings as a protective mechanism against corrosion and deterioration of industrial structures.

#### PLANNING & SPECIFYING INDUSTRIAL PAINTING PROJECTS (C2)

**JAN. 27-31**

C2 is designed to provide those who understand coating fundamentals with an overview of the principles of planning, awarding and monitoring the quality of

new construction or maintenance painting projects. Students will become familiar with tools to develop effective coating projects and play a more active role in managing painting projects to successful completion.

## COATING APPLICATION SPECIALIST REFRESHER (CAS REF)

**JAN. 28**

The CAS Refresher is an overview of surface preparation and application covered in the Body of Knowledge of SSPC-ACS 1/NACE No. 13 Applicator Certification Standard No. 1, Industrial Coating and Lining Application Specialist Qualification and Certification. It covers topics in surface preparation and coating application and is especially designed for employees that are new to the coatings industry.

## BRIDGE MAINTENANCE: CONDUCTING COATING ASSESSMENTS (BRIDGE)

**JAN. 28-29**

This course covers the fundamental inspections skills required to conduct a coating condition assessment of an in-service steel bridge. It provides a wide range of concerns that can affect the condition

of the coating and presents a reporting and rating system, enabling the owner to make an educated decision on how to repair the damaged and deteriorated coating. The course also covers the basics of corrosion and coating types and characteristics related to steel bridges.

## LEAD PAINT REMOVAL (C3)

**JAN. 28-31**

The C3 course includes background information on the hazards of lead and other toxic metals, as well as the current legal and regulatory environment. The course contains specific discussions on protecting workers, compliance with environmental regulations, proper management of waste streams and operations that result in potential exposures to lead and associated control technology. The course also addresses reading specifications and developing programs to effectively control risks to workers, the public, and the environment.

It concludes with a discussion of insurance and bonding issues and an introduction to other safety and health issues.

## COATING APPLICATION SPECIALIST (CAS)

**JAN. 29 (LEVEL 1);**

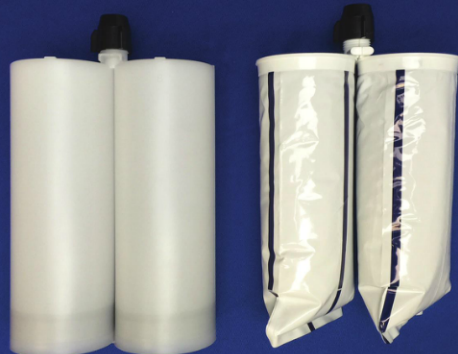

**JAN. 29-30 (LEVEL 2)**

The CAS certification program is designed to certify individual craft workers who have experience and training in all aspects of hands-on surface preparation and coating application of complex industrial and marine structures. This program consists of written exams only; no formal training is offered during this program.

## SELECTION OF COATINGS

**JAN. 29**

This course covers the skills required to specify and select a coating for a specific structure or environment. It defines the primary function of a coating, the types of

substrates that are painted and the challenges of matching a coating to a service environment to properly protect the structure from corrosion.

#### **BASICS OF ESTIMATING INDUSTRIAL COATINGS PROJECTS (EST)**

**JAN. 29**

This course covers the fundamentals of estimating industrial painting job costs including surface area calculations, labor and production rates, and equipment and material requirements.

#### **INSPECTION PLANNING AND DOCUMENTATION (INSPEC PLAN)**

**JAN. 29-30**

This course will teach coating inspectors how to plan inspections effectively before the work begins and document results of tests and inspections conducted. The training will emphasize carefully reviewing

plans and specifications in order to develop a comprehensive inspection plan, as well as using forms to accurately and legibly document project-specific inspection and test results, non-conforming work, and rework. This course is designed for practicing coating inspectors already familiar with commonly used coating inspection instruments and standards of practice.

#### **DEVELOPING AN EFFECTIVE COATING SPECIFICATION (DEV CTG SPEC)**

**JAN. 29-31**

This course is designed to provide facility owners, coating managers and specification designers with practical guidance and tools to be used in creating competent industrial coatings specifications that better ensure contractor conformance with job requirements. It reviews the concerns that can affect project success, presents a checklist for developing coating

specifications and focuses on the technical requirements to consider when preparing specifications for coating work, with an emphasis on steel and concrete industrial and marine structures.

#### **LEAD PAINT REMOVAL REFRESHER (C5)**

**JAN. 30**

This one-day course provides refresher training for supervisors and competent persons who are responsible for industrial de-leading operations. It includes a review of basic information about lead and its human health hazards; a review and update of relevant EPA regulations and progresses through discussions of 29 CFR 1926.62 and changes in the Respiratory Protection Standard (29 CFR 1910.134); and discussions about emissions control as presented in SSPC-Guide 6.

## EVALUATING COMMON CONTRACT CLAUSES (CONTRACT)

**JAN. 30**

This course will provide a basic overview of the clauses most common to coatings contracts. It follows the outline of a standard construction contract while also teaching students to identify the key provisions that may be missing from contracts they receive.

## PROTECTIVE COATINGS INSPECTOR (PCI) WORKSHOP

**JAN. 30**

This one-day workshop trains individuals in the proper methods and equipment for inspecting surface preparation and installation of industrial and marine protective coatings and lining systems on an array of industrial structures and facilities. It was

designed as a supplement to students who have completed the PCI online program.

## SPRAY APPLICATION BASICS (C12)

**JAN. 31-FEB. 1**

C12 is designed to train and certify marine and industrial applicators to operate airless spray equipment. The course also assesses the skills of applicators who have at least 800 hours applying protective coatings with airless spray.

## PROJECT MANAGEMENT FOR THE INDUSTRIAL PAINTING CONTRACTOR (PRO MGMT)

**JAN. 31-FEB. 1**

This course offers an introduction to project management concepts used on industrial painting projects. Attendees will

learn about generating new business, reviewing contracts, navigating employee relations, and building safety into the job. The second day of this course involves an exam in which participants resolve real-world project management scenarios.

## QUALITY CONTROL SUPERVISOR (QCS)

**JAN. 31-FEB. 1**

The QCS program provides training in quality management for SSPC-certified contractor personnel, Technical Quality Managers (TQM) and inspectors employed by SSPC-QP 5 inspection firms. It gives an overview of the quality management aspects of surface preparation, paint, coatings and inspection operations that a QCS needs to know. It is highly recommended that persons attending the QCS course have recent inspection training or equivalent formal training and some quality control experience.

## NAVIGATING NAVSEA STANDARD ITEM 009-32 (00932)

**FEB. 1**

This course provides attendees with a better understanding of the painting requirements outlined for U.S. Navy surface ships, submarines and aircraft carriers in Standard Item 009-32. It covers the cleanliness, surface preparation, coating application requirements and system application instructions for various Navy vessels. Requirements of referenced standards are also reviewed.

## CCI SUPPLEMENT: DETERMINING THE LEVEL OF MOISTURE IN CONCRETE (CCI SUPP)

**FEB. 1**

This certification course covers the skills required to conduct moisture testing of concrete substrates prior to coating application. It defines and explains the steps for measuring moisture in accordance with ASTM Standard Test Methods. Candidates must have taken and passed the Certification Level of SSPC's CCI Program.

**YOU NEED TO TEST IT...

## INSPECTING CONTAINMENT

**FEB. 1**

This course covers how to determine what type of containment is necessary from the specification of work and the supplied drawings at the job site. It will discuss the role the inspector plays when inspecting the removal of toxic coatings within these structures.

## USING SSPC-PA 2 EFFECTIVELY (PA 2)

**FEB. 1**

This half-day workshop explains the key highlights of SSPC-PA 2: Measurement of Dry Coating Thickness with Magnetic Gauges. Students will learn to verify the accuracy of a DFT magnetic gauge; measure the DFT of a coating with a Type 1 or Type 2 gauge; and describe and implement the procedure to determine if the film thickness in a given area conforms to the maximum and minimum levels specified.

## PROTECTIVE COATINGS SPECIALIST PROGRAM (PCS)

**FEB. 1**

The PCS certification program identifies and awards recognition to individuals who have in-depth knowledge of industrial coatings technology. The PCS is SSPC's highest level of certification and demonstrates mastery in assessment of coatings systems, development of coatings specifications, surface preparation and coatings applications, economics of coatings, contract planning and management, coating failure analysis and inspection.

## ABRASIVE BLASTING PROGRAM (C7)

**FEB. 2-3**

C7 is designed for contractor personnel who wish to obtain certification or others who wish to learn about dry abrasive blast cleaning of steel. It covers principles of surface preparation, surface cleanliness, surface profile, dust and debris control and abrasives. Students who do not want to receive the C7 certification can receive a certificate of attendance by attending the lecture portion of the training and observing the blaster demonstration.

## DOD FUNDING FOR SSPC 2016 COURSES

Under the DoD Corrosion Prevention and Control Program, funding for some of the courses offered at SSPC 2017 featuring GreenCOAT has been provided to train DoD, Army, Navy, Air Force, Marine Corps and Coast Guard personnel. Funding is on a first-come, first-served basis, and only the cost of the course and exam are funded under the contract. Other costs, such as labor, travel and per diem are to be covered by the participant. For more information, contact Jennifer Merck at 877-281-7772, ext. 2221; or merck@sspc.org.

## The Smart Alternative to Mineral Abrasives

- ▲ Up to 70X greater durability than mineral abrasives
- ▲ Virtually dust free
- ▲ Significant cost reduction
- ▲ Stable process/consistent surface roughness resulting in optimum adhesion

# 2017 ANNUAL COATING SYSTEMS BUYING GUIDE

The 2017 *JPCL* Annual Coating Systems Buying Guide features over 350 coating manufacturers and details about high-performance coating systems suitable for steel and concrete substrates on bridges, in chemical and petrochemical plants, food and pharmaceutical plants, marine and offshore structures, railcars, power plants, transmission pipelines, wastewater facilities, water works, and waterfront, locks and dams, as well as specialty function applications. The Guide is published as a resource for facility owners, third-party specifiers, contractors and anyone else engaged in a coatings project and allows the user to identify systems that companies recommend for specific applications, exposures, substrates and specialty functions.

**SACI®**  
CORROSION INHIBITORS

*Keep Them In Service Longer In Environmentally Safer Ways.*

PROTECTANTS • COATINGS • PENETRATING SEALANTS • CAULKS

**SACI® corrosion inhibitors offer an environmentally responsible solution to corrosion prevention of metal\* structures facing severe atmospheric conditions.**

Having a structure of highly polar, overlapping microscopic platelets that block moisture, SACI® corrosion inhibitors resist cracking and peeling, are thermally stable, and hold fast to sharp edges.

Environmentally, SACI® formulations offer lead and barium free options, so run-off doesn't have the toxicity of traditional coatings. Even barges, bearings, cables, engines, tanks, offshore rigs and platforms operating within the harshest salt-water environments benefit from products incorporating SACI® corrosion inhibitors for long-term protection.

**Formulators Note:** SACI® corrosion inhibitors are multi-functional compounds used in the formulation of materials requiring exceptional resistance to sag, run-off, and flow, even at high film buildup and elevated temperatures. Use SACI® corrosion inhibitors alone or in combination with:

- Aliphatic and aromatic solvents
- Hydrocarbon resins
- Asphalt
- Polymers
- Waxes

**Talk To A Daubert Representative**  
Contact us and we'll be happy to discuss standard or custom formulation needs, including the following:

- Anti-settling agents
- Pigment dispersing agents
- Rheological modifiers

Don't let the ship sail without you aboard!  
Be sure to add EthoFlex™ER to your new epoxy coatings!

EthoFlex™ER tremendously improves the critical coating properties that are diminished when adjusting epoxy formulations to meet VOC regulations. It is the only additive that simultaneously enhances **corrosion resistance, flexibility, adhesion, toughness, and gloss. Pot life and cure time** may also be improved. All of these remarkable improvements may be gained without adding VOCs.

Prepare for tomorrow by choosing Ethox Chemicals as your innovative solution provider!

## Measure Surface Profile And Coating Thickness With One Instrument

Fischer's FMP Series paired with the NEW digital surface profile probe is more repeatable and efficient than other methods

- Measure peak-to-valley distances according to ASTM D4417 Method B and other standards
- Assessment of blasted surfaces before coating
- Rugged probe tip is field replaceable
- Automatic maximum results
- Easily interchangeable with coating thickness probes

(860)683-0781

# An Investigation of How Good Specifications Prevent Coating Failures

**OCTOBER 19, 2016**

**11:00 AM - 12:00 PM EASTERN**

**REGISTER NOW AT**

**PAINTSQUARE.COM/WEBINARS**

This webinar presents a scientific approach to the analysis and prevention of common paint and coating failures on industrial structures. It begins with a close look at the structure, composition and properties of polymers used in the formulation of modern paints and coatings, followed by a systematic consideration of failures induced by weather, corrosion, mechanical and chemical influence, light, heat, and other agents. Participants will be eligible to receive credit from SSPC.

**Presenter: Sarah Olthof, GPI**

## Product Profile Webinar: Advancements in Vapor Abrasive Blasting Technology

**NOVEMBER 3, 2016**

**11:00 AM - 12:00 PM EASTERN**

**REGISTER NOW AT**

**PAINTSQUARE.COM/WEBINARS**

Methods of combining water with abrasive blasting to reduce dust in coating removal, cleaning and other general surface preparation applications have existed for decades; yet the perception remains that these methods are messy, unreliable and not much different than a wet slurry coming out of the blast nozzle. The purpose of this webinar is to explain vapor abrasive blasting in detail, showing both how it works and the technology advancements that have resulted in better media control, simpler operation, improved performance and more versatility to cover a variety of applications. The attendee will leave the webinar with an understanding of how vapor abrasive blasting can reduce dust up to 92% and lead to a cleaner, easier path to profitable results for many applications.

**Presenter: Eric Rennerfeldt, Graco**

## SewerGard® Lining Systems

Trowelable, Sprayable & Glaze Coat Formulations

### NOVOLAC EPOXY Formulation for the ultra-corrosive industrial wastewater environment

Designed to protect concrete and steel from chemical attack and provide high-strength, corrosive-resistant linings for treatment facilities and collections systems commonly found in industrial plants where aggressive chemicals are used.

Call us or visit us online for more information on our Engineered Lining Systems.

COMING THIS WINTER IN D+D MAGAZINE:

# TOP CHALLENGES

Industry thought leaders explore the critical topics and challenges impacting key segments in the architectural coatings market and share potential solutions.

Coverage will report on the **TOP CHALLENGES** in these critically important segments:

- Concrete Floor Coatings
- Building Enclosures
- Maintenance & Restoration
- Quality Control & Quality Assurance
- Decorative Painting
- Color & Design
- Specifying Practice

## ALSO FEATURING

- Concrete Coatings Resource Center
- Directories: Suppliers, Consultants and Contractors

To ensure you don't miss this and future issues, go to [www.durabilityanddesign.com/subscribe](http://www.durabilityanddesign.com/subscribe) and sign up today.
